SAME OR DIFFERENT? Relations between apparently different graph models

Thursday, April 14, 2011 9:00 AM (45 minutes)

Apparently different (sparse) graph models can lead to identical behaviour. An example is given by the Poissonian mix subclass of the Configuration Model and the rank one subclass of Inhomogeneous Random Graphs. Similar relations can be found between unrestricted versions of these models and a sparse model superclass, which can be viewed as a configuration model with hidden variables.
