Outline

I. Introduction: Clean carbon nanotubes

- What is a clean carbon nanotube?
- Quantum dots in clean nanotubes: Klein Tunnelling

II. Nanomechanics

- High quality mechanical resonators
- Coupling single electrons to nanomechanical motion
- The Future: Quantum Nanomechanics?

Clean Carbon Nanotubes

What is a "clean" carbon nanotube?

Conventional Nanotube Device

What is a "clean" carbon nanotube?

"Clean" nanotube device

Nanotube last

"flip device upside down"

Metal Layer

Gate Layer

Dielectric

Dielectric

Backgate

Nanotube growth ...

900°C

Co, $T_m = 1495\text{ C}$

Cr
 $T_m = 2180\text{ C}$
(sublimes at
1800 C)

Cr/Au
Au $T_m = 1064$ C

This scanning electron microscope (SEM) image displays a porous, interconnected network structure of a Cr/Au thin film. The structure consists of irregular, interconnected channels and voids, creating a highly porous morphology. The walls of these channels are composed of a thin layer of material. The overall appearance is that of a sponge-like or honeycomb-like structure. The text overlay in the upper left quadrant provides the material composition and the melting temperature of the gold component.

Pd
(nanotube catalyst)

Fe
(nanotube catalyst)

The Solution: W/Pt and Silicon!

W/Pt

SiO₂

n++ Si

SiO₂

Then we need a nanotube...

Is it worth it?

The advantages of clean

Extremely Low Disorder

Strong Interaction with Light

Exceptional mechanical properties

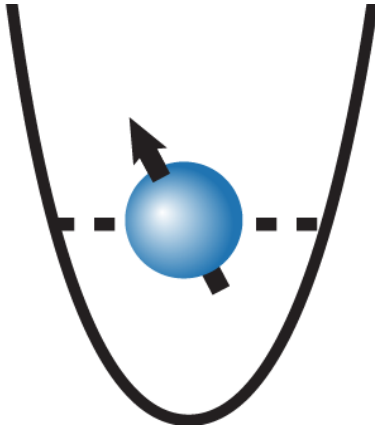

Clean nanotube quantum dots

Steele *et al.* Nature Nanotechnology (2009)

What is our motivation?

Spin Quantum Bit

Use spin states of a single electron as a quantum bit

$$|\uparrow\rangle$$

$$|\downarrow\rangle$$

Why Spins?

Weakly coupled to the environment

GaAs Spin Qubits:

Problems with nuclear spins...

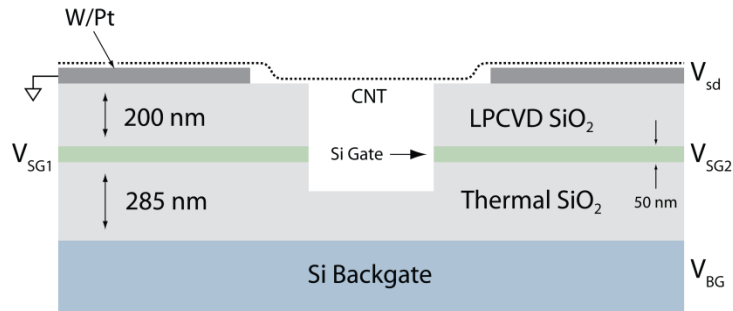

**^{12}C Carbon Nanotubes:
No Nuclear spins**

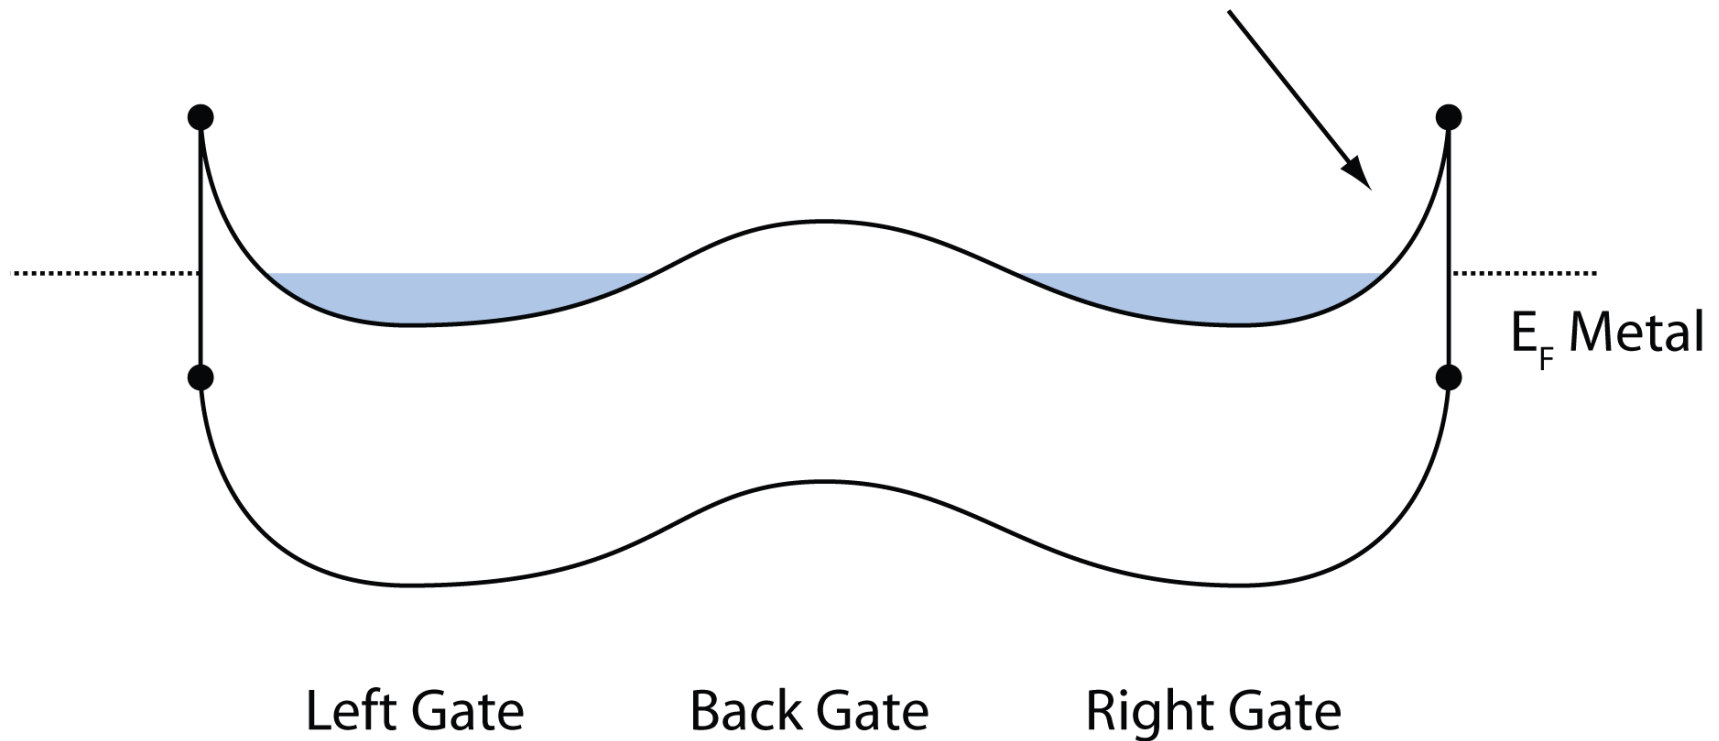

Nanotube quantum dots: The Device

A quantum dot with three gates

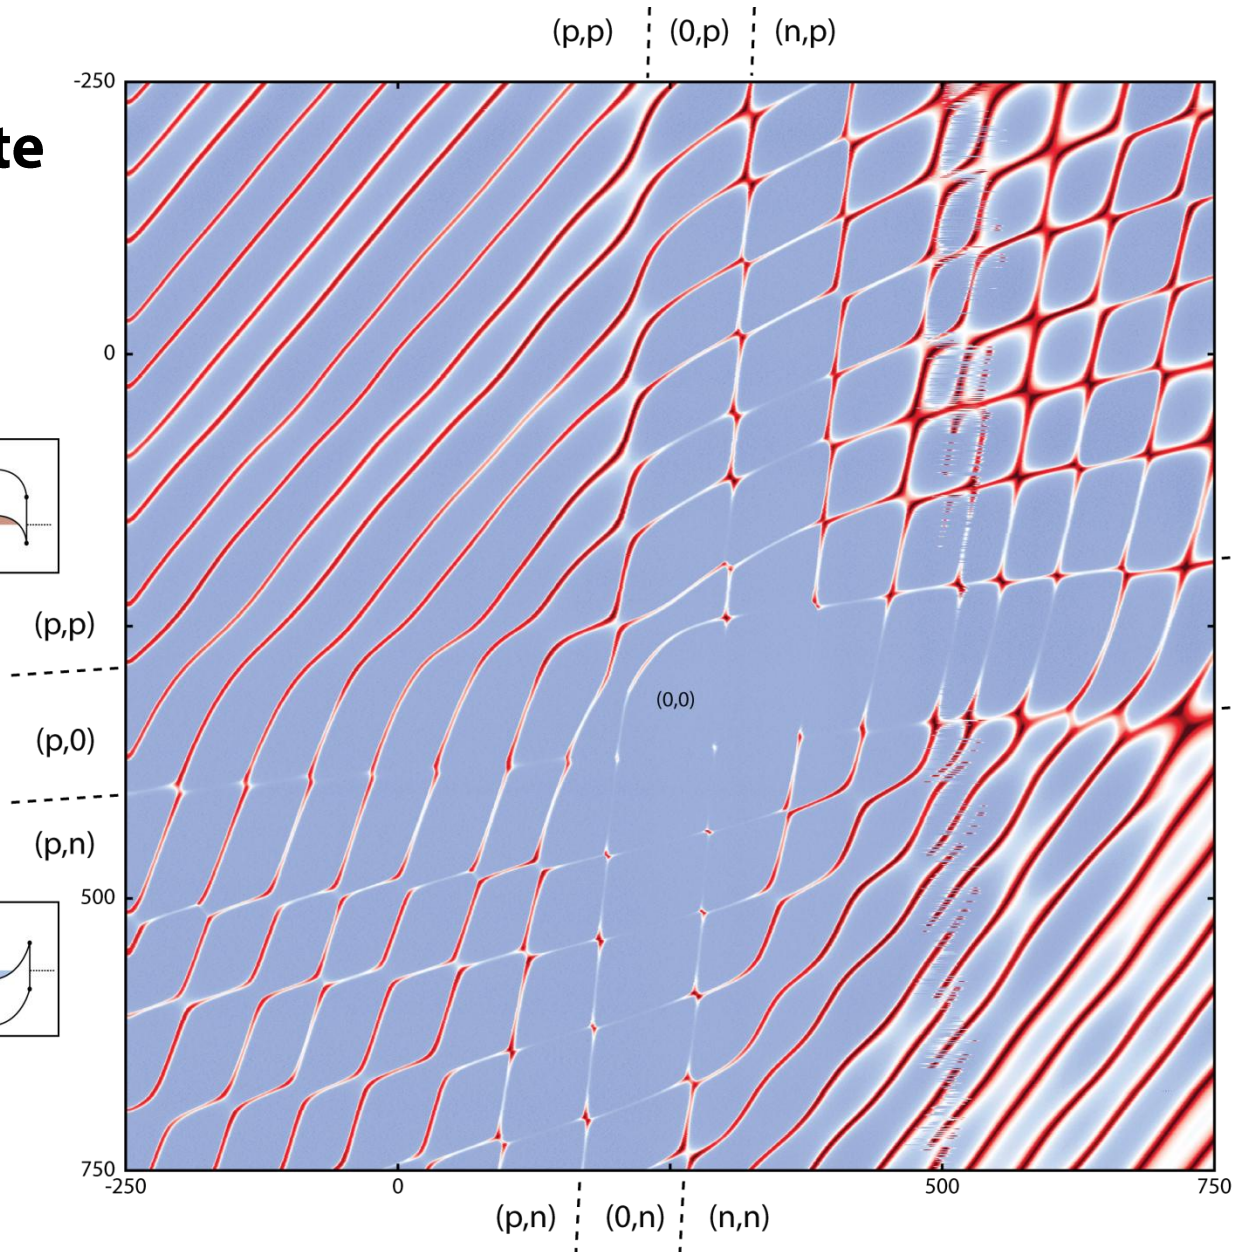

Tunnel Barrier

Finding the last electron

Right Gate

(n,p)

$(n,0)$

(n,n)

Left Gate

A double quantum dot

$$V_{BG} = 0 \text{ mV}$$

That we can control

$V_{BG} = 250$ mV

Klein Tunneling: What is Klein Tunneling?

Tunneling in the Dirac equation

What does this have to do with nanotubes?

Dirac Fermions

Electrons in a nanotube

Klein Tunneling in a nanotube

Current decreases as barrier goes up

Current *increases* as barrier goes up?

Normal
Tunneling

Klein
Tunneling

Nanotube Nanomechanics

Huettel *et al.* NanoLetters (2009)

Steele *et al.* Science (2009)

Nanomechanical Resonators

A SiN beam resonator

Why nano?

$$\omega = \sqrt{\frac{k}{m}} \quad \text{If } \hbar\omega > k_B T$$

“quantum limit of macroscopic motion”

$$\omega = \sqrt{\frac{k}{m + dm}}$$

Mass sensing: if m is small, then we can detect small changes dm of the resonator

Why nanotubes?

Nanotubes:

Light

10^{-21} kg vs. 10^{-18} kg

Stiff

Large Young's
Modulus

High Q?

Single crystal,
No etching defects

Tunable Nanotube Resonators

Sazanova *et al.*, Nature **431**, 284 (2004)

$Q = 80?$ (2004)

(Recent results: $Q \sim 1000$ at
1.2K in 2008)

Where is the high Q?

Suspended nanotube quantum dot

Our measurement

$T = 20 \text{ mK}$

Apply RF

Measure DC Current

Sweep Frequency

A resonance

Very high Q-factor!

Mechanical Signature of the Resonance

How do we detect mechanical motion?

$$Q_{\text{dot}} = C_g V_g \quad C_g = C_g(z)$$

Move nanotube
= Effective Change in Gate Voltage

Oscillating nanotube:
Change DC Current

Detection Mechanism: Rectification

Resonance Signal can have either positive or negative sign

$$\Delta I \propto \frac{\partial^2 I}{\partial V_G^2}$$

Quantum dot detector

Quantum dot: detects mechanical motion

Can it also influence it?

Zoom in

Tuning a Resonator with a Quantum Dot

Tuning a Resonator with a Quantum Dot

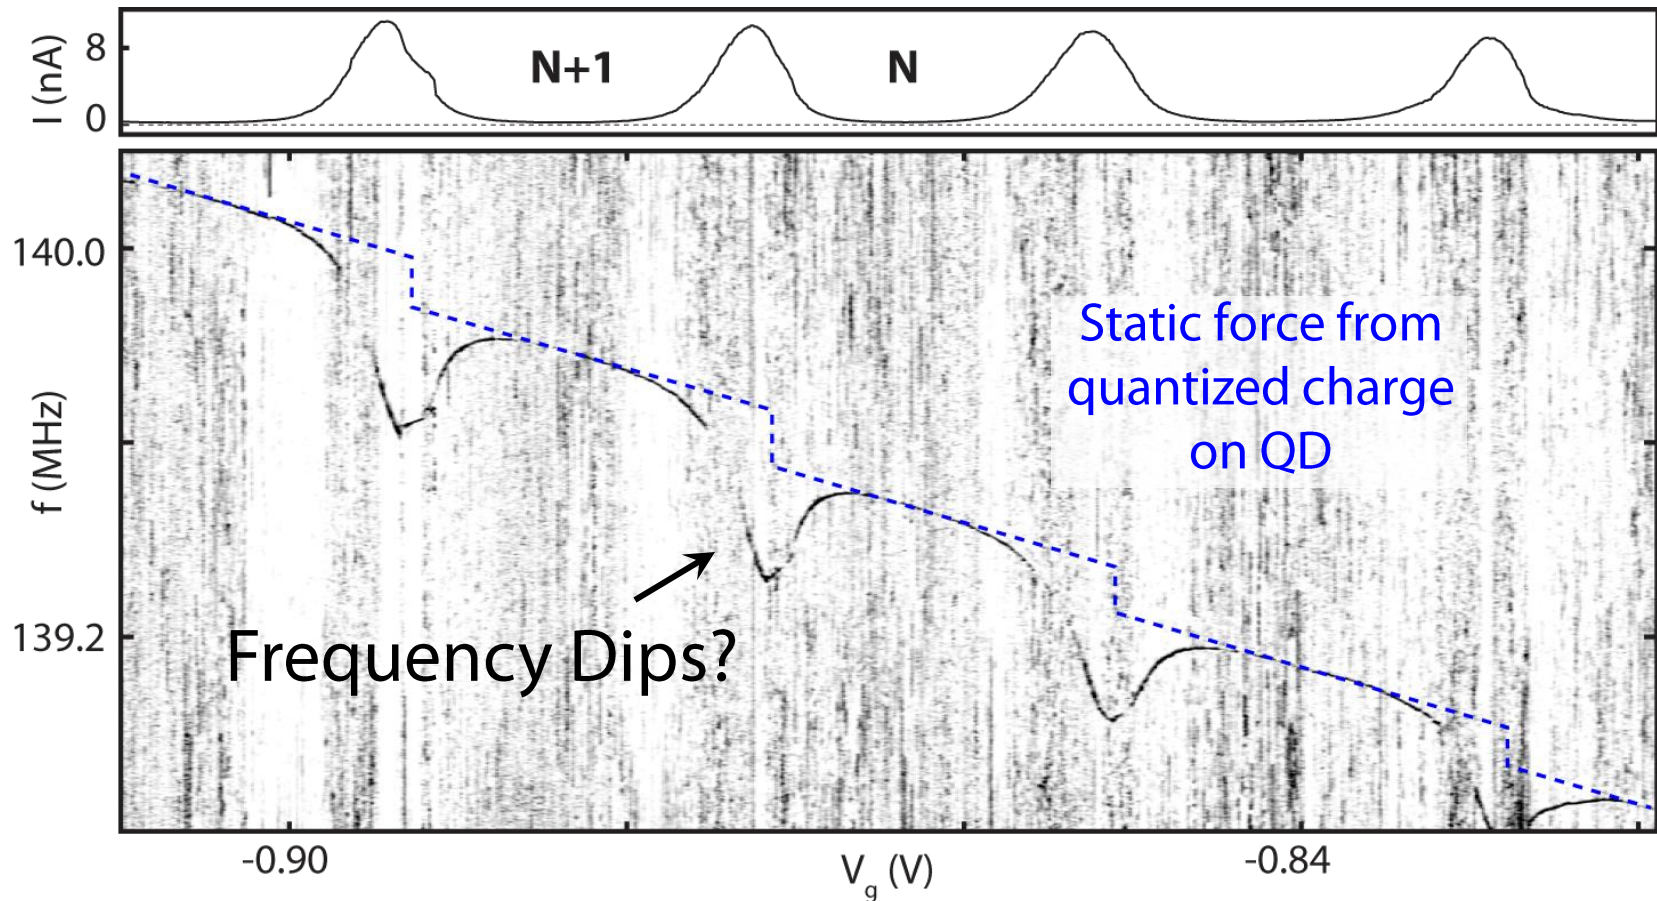

Quantized charge
on quantum dot

Steps in resonance
frequency

Tuning a Resonator with a Quantum Dot

Dips are strange: go the wrong way?

Dips: Dynamic Force from Charge Fluctuations

Charge fluctuations:

$$\omega_{mech} \ll 1/\tau \longrightarrow$$

Changes **electrostatic** part of spring constant ("overscreening" by QD)

Single Electron Damping

Electrostatic energy gain
during tunnelling

Higher driving power

Line shape at higher power

$$-kx \rightarrow -(k + \alpha x^2)x$$

$$\alpha < 0$$

“softening spring”

$$\alpha > 0$$

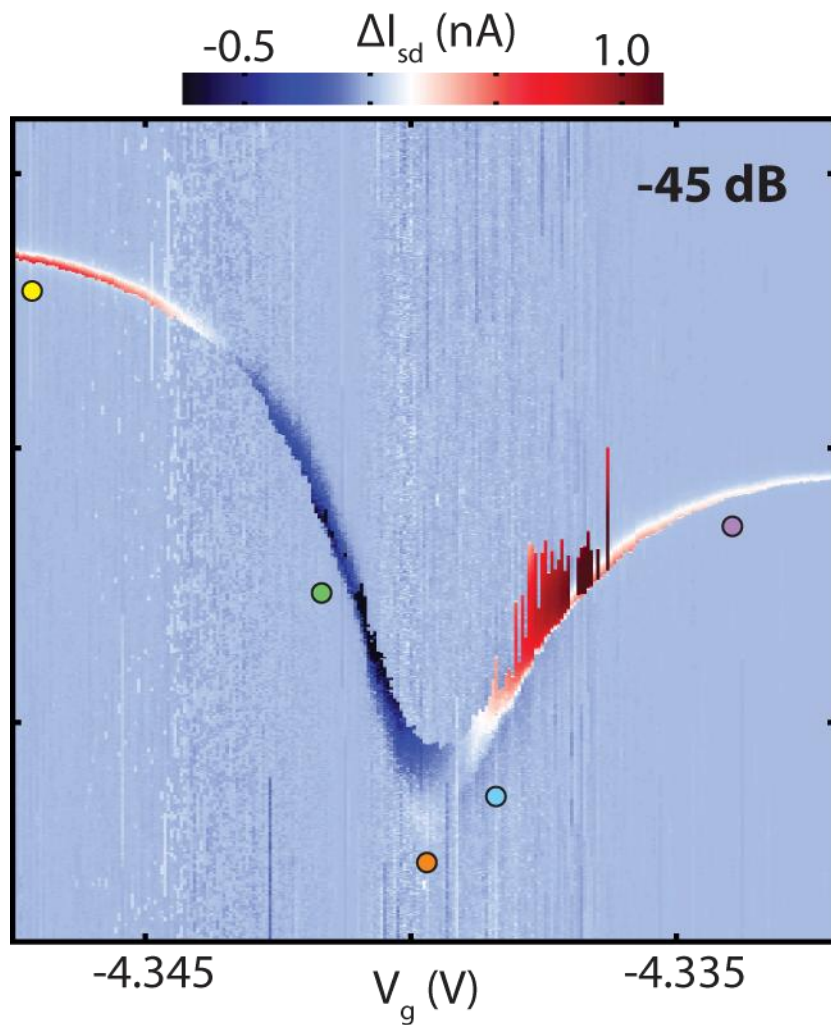

“hardening spring”

Sign of α changes?

ΔV_g
 \sim
few
mV

Quantum Dot Induced Non-Linearity

Quantum dot *causes* the non-linearity

Higher powers...

Synchronous pumping of electrical current by mechanical motion?

Turn off the RF driving

Turn off RF

but

Apply a DC bias
across the dot...

A normal quantum dot

Coulomb Diamonds

Differential conductance
(dI/dV)

Energy levels in
the quantum dot

Quantized level
spacing, Zeeman
energy, Orbital
energies, ...

What does our quantum dot look like?

What is this? Could it be mechanical?

Positive feedback mechanism

PHYSICAL REVIEW B 75, 195312 (2007)

Strong feedback and current noise in nanoelectromechanical systems

O. Usmani, Ya. M. Blanter, and Yu. V. Nazarov

Kavli Institute of Nanoscience, Delft University of Technology, Lorentzweg 1, 2628 CJ Delft, The Netherlands

(Received 8 March 2006; revised manuscript received 16 February 2007; published 10 May 2007)

Need: $\Gamma \gg \omega$ and $Q \gg 1$

Mechanical Signature

“Spontaneous driving of mechanical resonator by single electrons”

A Quantum Nanomechanical Resonator

Q	150,000	80,000
Mass	10^{-21} kg	10^{-21} kg
Frequency	500 MHz	2.8 GHz
\bar{n} @ 100 mK	9.5	~0
Δx_{ZPF}	~5 pm	

Try to do something quantum...

Summary

Clean carbon nanotubes: a new breed

A cool platform for making quantum dot devices

High Q-factor mechanical resonators

Single electrons coupling to nanomechanical motion

A quantum future?
