(?) Explains simultaneously **all** phenomena that we call **dark matter**

(?) Explains *both* **astrophysical** *and* **cosmological** dark matter

(?) Is **testable**

(?) Is part of the solution for other beyond-the-Standard-Model problems

# Neutrino Dark Matter?

Tremaine &  
Gunn'79

- Any **fermionic** DM should obey Pauli exclusion principle  
⇒ its mass is bounded from below:

$$\frac{M_{\text{gal}}}{\frac{4\pi}{3}R_{\text{gal}}^3} \frac{1}{\frac{4\pi}{3}v_{\infty}^3} \leq \frac{2m_{\text{DM}}^4}{(2\pi\hbar)^3}$$

Macroscopic quantities

micro-physics

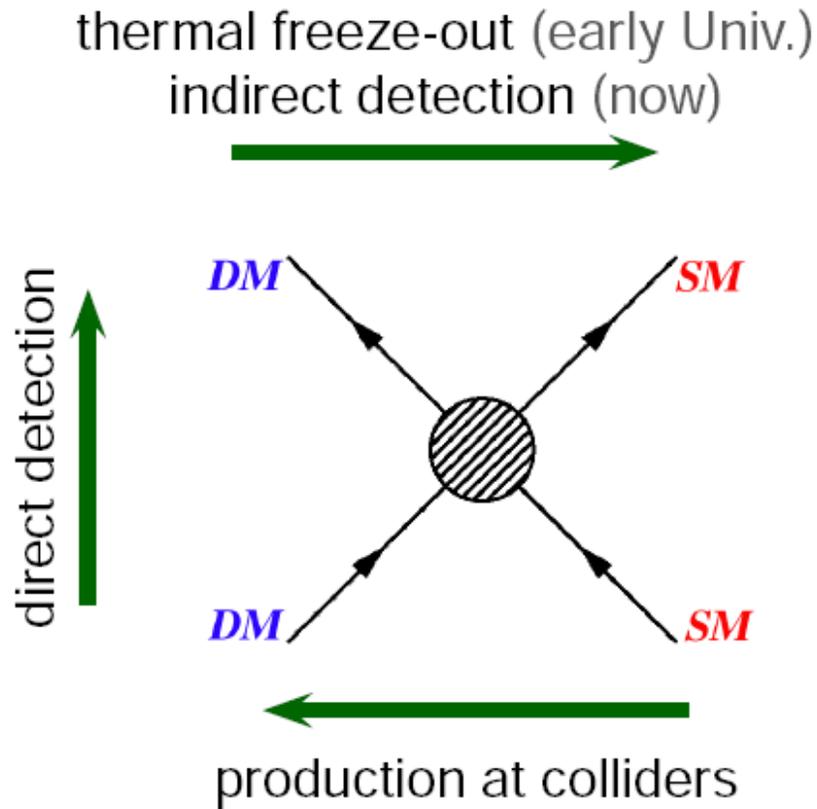

- Dwarf spheroidal galaxies lead to the lower bound on the fermionic DM mass  $M_{\text{DM}} \gtrsim 300 - 400 \text{ eV}$  ← **DM mass from astrophysics**
- Neutrino DM abundance:

Boyarsky et al  
[0808.3902]

$$\text{Fraction of total energy density} = m_{\nu} \int \frac{d^3k}{(2\pi)^3} \frac{1}{e^{\frac{k}{T}} + 1} = \boxed{\frac{m_{\nu} [\text{eV}]}{94 \text{ eV}}}$$

- **Neutrino DM mass from cosmology:  $M_{\nu\text{DM}} \lesssim 11 \text{ eV}$**

# Way out: WIMP

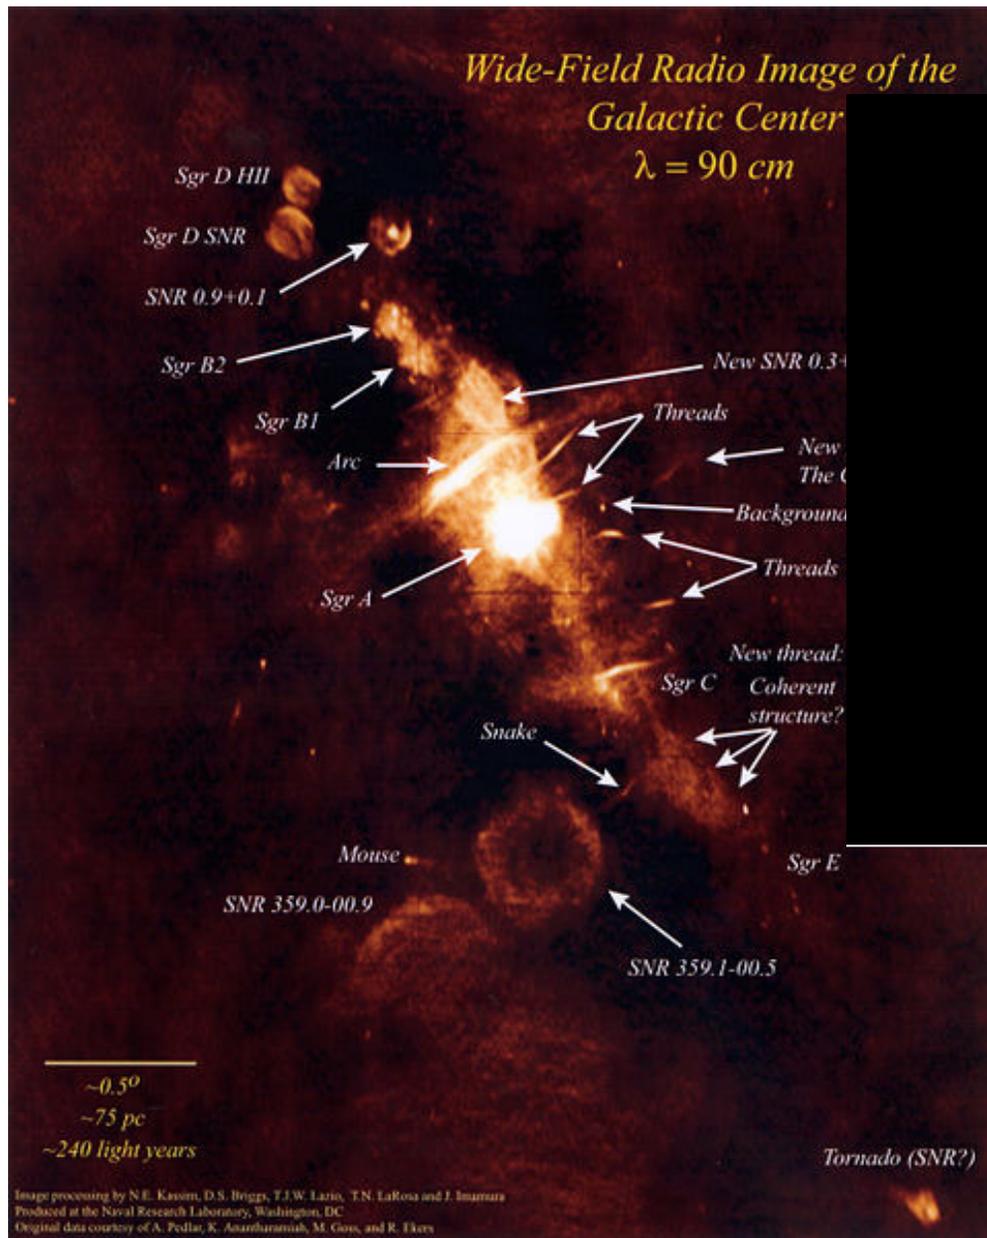

- ✓ Interacts like “neutrino” but is significantly **heavier**. Number density is Boltzmann-suppressed and Tremaine-Gunn-like contradiction is avoided
- ✓ The same interaction that is responsible for WIMP production is responsible for its detection today

- ✓ Because of the WIMP miracle is part of the overall “new physics at electroweak scale” paradigm

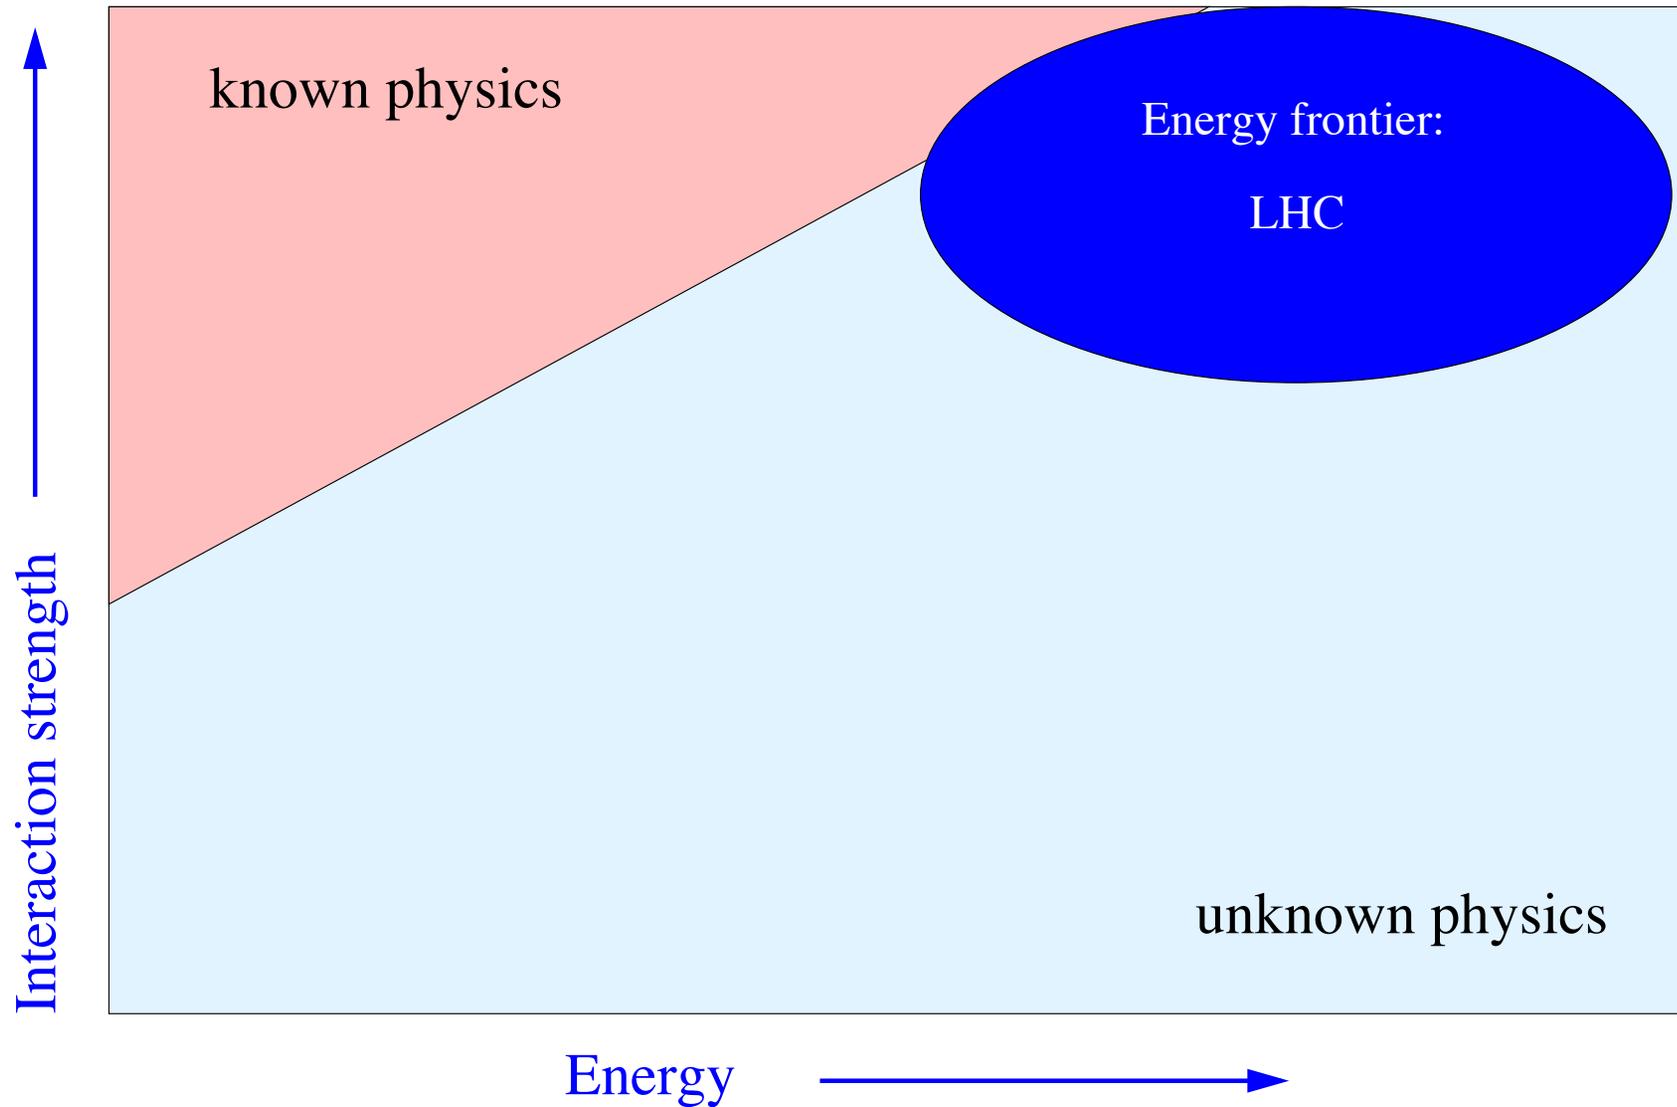

**Very attractive idea. But no signals so far!**

# Galactic center is a busy place

Annihilation signal from the Milky way-like galaxy. If found – hard to cross-check

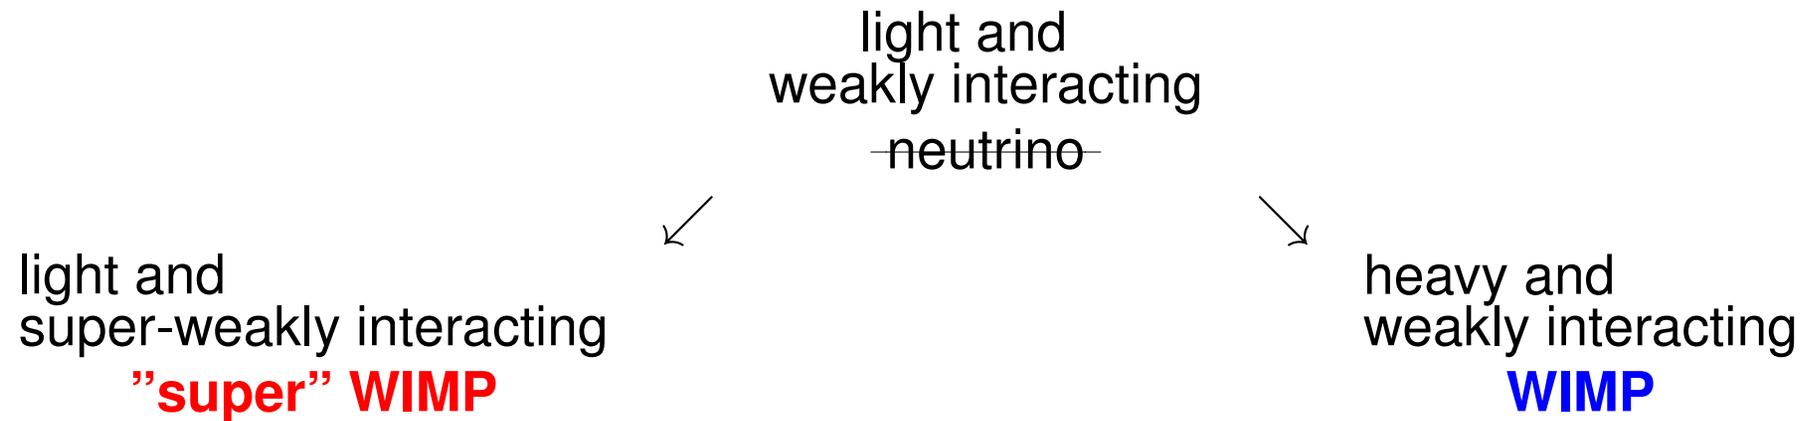

# New physics at electroweak scale?

**Alternatives?**

# Another way out: SUPER-weakly Interacting Particles

---

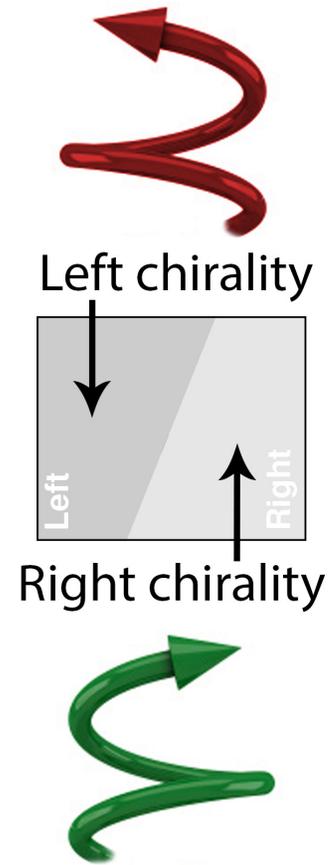

- **Can be light** (all the way to Tremaine-Gunn bound)  
particles never enter thermal equilibrium, their number density is highly sub-equilibrium
- **Can be warm** (born relativistic and cool down later)
- **Can be decaying** (stability is not required)  
massive particles will decay unless we impose a new symmetry to keep it stable

---

# **Sterile neutrino dark matter**

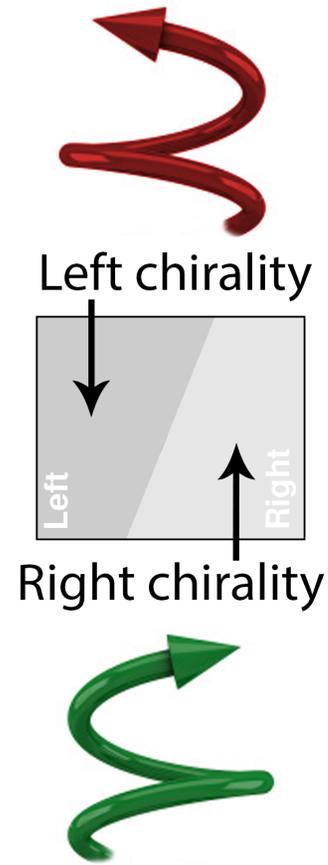

# Oscillations $\Rightarrow$ new particles!

## Right components of neutrinos?!

## Properties of sterile neutrino

Sterile neutrinos behave as **superweakly interacting** massive neutrinos with a smaller Fermi constant  $\vartheta \times G_F$

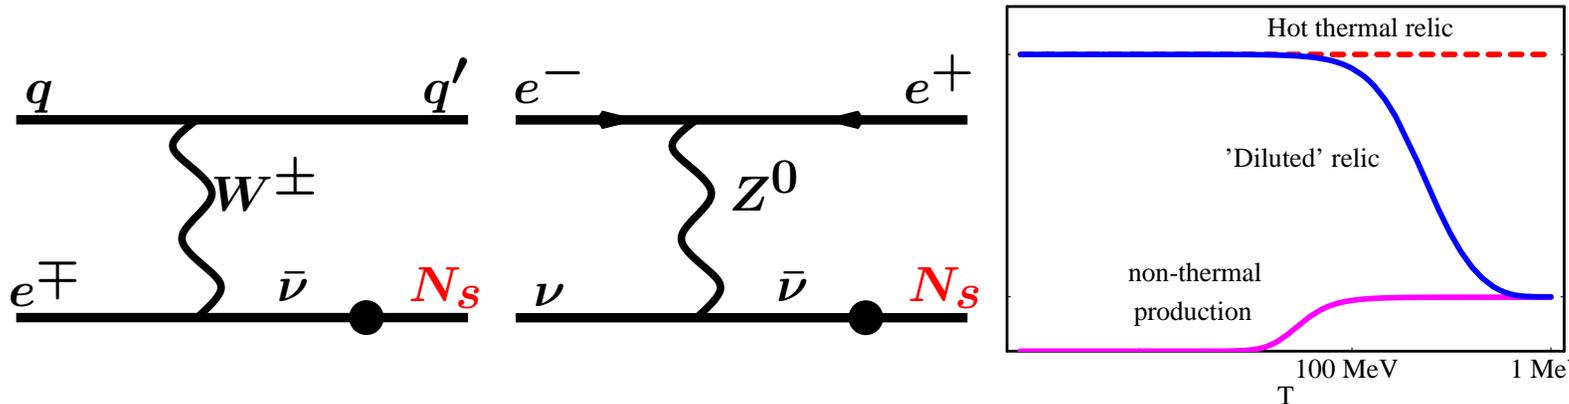

- This **mixing strength** or **mixing angle** is

$$\vartheta_{e,\mu,\tau}^2 \equiv \frac{|M_{\text{Dirac}}|^2}{M_{\text{Majorana}}^2} = \frac{\mathcal{M}_{\text{active}}}{M_{\text{sterile}}} \approx 5 \times 10^{-11} \left( \frac{1 \text{ GeV}}{M_{\text{sterile}}} \right)$$

# Sterile neutrino dark matter

- **Sterile neutrino** is a new neutral particle, interacting **weaker-than-neutrino**
- Never was in thermal equilibrium in the early Universe  $\Rightarrow$ 
  - $\Rightarrow$  Its abundance **slowly builds up** but **never reaches the equilibrium** value
  - $\Rightarrow$  avoids Tremaine-Gunn-like bound

Dodelson & Widrow'93;  
Dolgov & Hansen'00

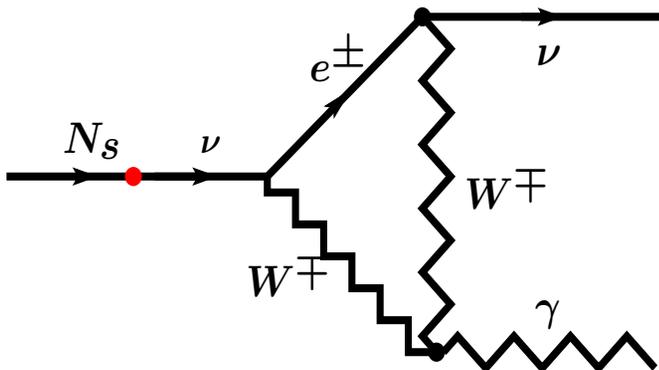

- Once every  $\sim 10^8 \div 10^{10}$  scatterings a sterile neutrino is created instead of the active one

# Sterile neutrino dark matter

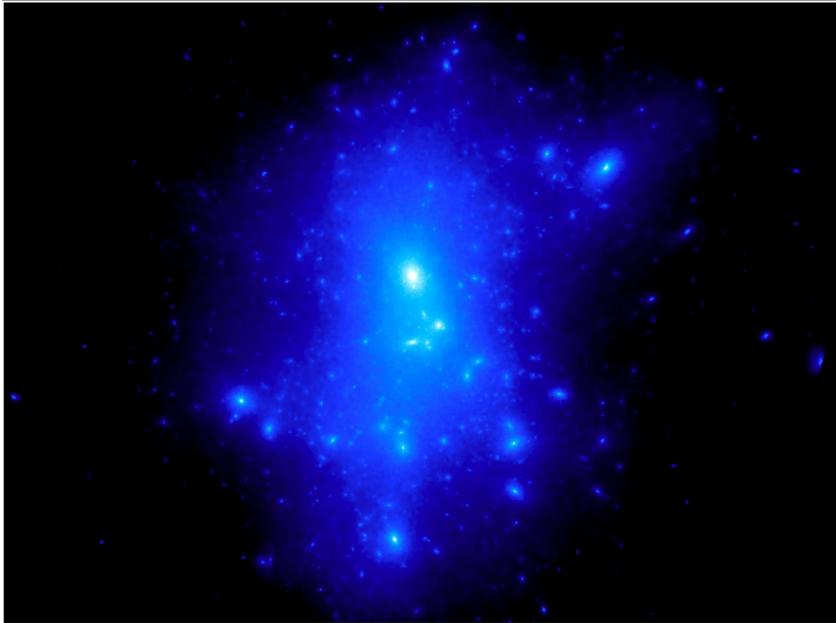

---

- Very hard/impossible to search at LHC
- Very hard/impossible to search in laboratory experiments
- Can be **decaying** with the lifetime exceeding the age of the Universe
- Can we detect such a rare decay?
- **Yes!** if you multiply the probability of decay by a large number – amount of DM particles in a galaxy (typical amount  $\sim 10^{70}$ – $10^{100}$  particles)

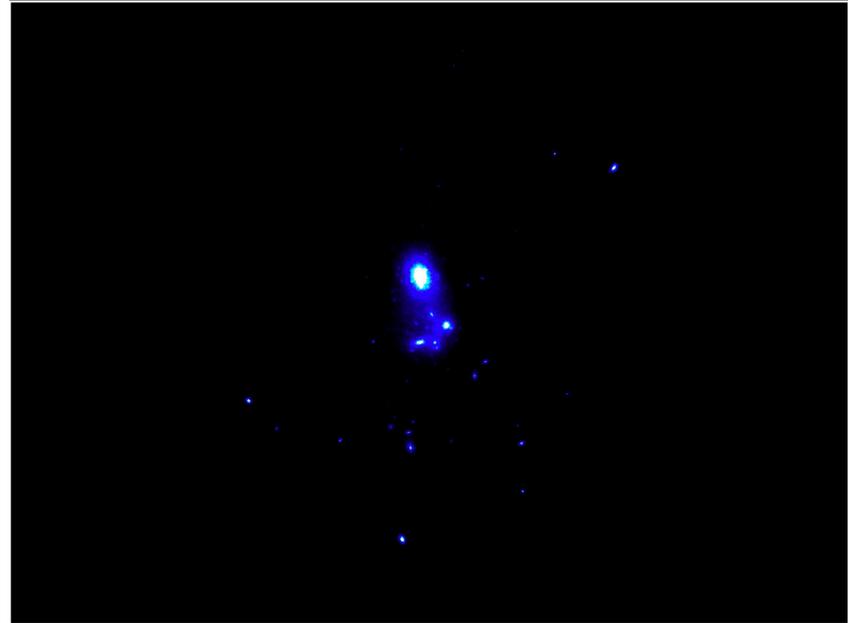

# Search for decaying dark matter

---

DM **decay** signal from a galaxy

DM **annihilation** signal from a galaxy

For decaying dark matter astrophysical search is (almost) “**direct detection**” as any candidate line can be unambiguously checked (confirmed or ruled out) as DM decay line

# Decaying dark matter signal

---

- Two-body decay into two massless particles ( $\text{DM} \rightarrow \gamma + \gamma$  or  $\text{DM} \rightarrow \gamma + \nu$ )  $\Rightarrow$  narrow decay line

$$E_\gamma = \frac{1}{2}m_{\text{DM}}c^2$$

- The width of the decay line is determined by **Doppler broadening**
- Typical virial velocities:
  - A dwarf satellite galaxy:  $\sim 30$  km/sec
  - Milky Way or Andromeda-like galaxy:  $\sim 200$  km/sec
  - Typical velocity in the galaxy cluster  $\sim 1500$  km/sec
- Very characteristic signal: narrow line in all DM-dominated objects  
with  $\frac{\Delta E}{E_\gamma} \sim \frac{v_{\text{vir}}}{c} \sim 10^{-4} \div 10^{-2}$

## DETECTION OF AN UNIDENTIFIED EMISSION LINE IN THE STACKED X-RAY SPECTRUM OF GALAXY CLUSTERS

ESRA BULBUL<sup>1,2</sup>, MAXIM MARKEVITCH<sup>2</sup>, ADAM FOSTER<sup>1</sup>, RANDALL K. SMITH<sup>1</sup>, MICHAEL LOEWENSTEIN<sup>2</sup>, AND SCOTT W. RANDALL<sup>1</sup>

<sup>1</sup> Harvard-Smithsonian Center for Astrophysics, 60 Garden Street, Cambridge, MA 02138.

<sup>2</sup> NASA Goddard Space Flight Center, Greenbelt, MD, USA.

*Submitted to ApJ, 2014 February 10*

**[1402.2301]**

We detect a weak unidentified emission line at  $E=(3.55-3.57)\pm 0.03$  keV in a stacked XMM spectrum of 73 galaxy clusters spanning a redshift range 0.01-0.35. MOS and PN observations independently show the presence of the line at consistent energies. When the full sample is divided into three subsamples (Perseus, Centaurus+Ophiuchus+Coma, and all others), the line is significantly detected in all three independent MOS spectra and the PN "all others" spectrum. It is also detected in the Chandra spectra of Perseus with the flux consistent with XMM (though it is not seen in Virgo)...

# Detection of An Unidentified Emission Line

## An unidentified line in X-ray spectra of the Andromeda galaxy and Perseus galaxy cluster

A. Boyarsky<sup>1</sup>, O. Ruchayskiy<sup>2</sup>, D. Iakubovskiy<sup>3,4</sup> and J. Franse<sup>1,5</sup>

<sup>1</sup>Instituut-Lorentz for Theoretical Physics, Universiteit Leiden, Niels Bohrweg 2, Leiden, The Netherlands

<sup>2</sup>Ecole Polytechnique Fédérale de Lausanne, FSB/ITP/LPPC, BSP, CH-1015, Lausanne, Switzerland

[1402.4119]

We identify a weak line at  $E \sim 3.5$  keV in X-ray spectra of the Andromeda galaxy and the Perseus galaxy cluster – two dark matter-dominated objects, for which there exist deep exposures with the XMM-Newton X-ray observatory. Such a line was not previously known to be present in the spectra of galaxies or galaxy clusters. Although the line is weak, it has a clear tendency to become stronger towards the centers of the objects; it is stronger for the Perseus cluster than for the Andromeda galaxy and is absent in the spectrum of a very deep “blank sky” dataset...

## Data

---

### Our data

|                 |                                |
|-----------------|--------------------------------|
| M31 galaxy      | XMM-Newton, center & outskirts |
| Perseus cluster | XMM-Newton, outskirts only     |
| Blank sky       | XMM-Newton                     |

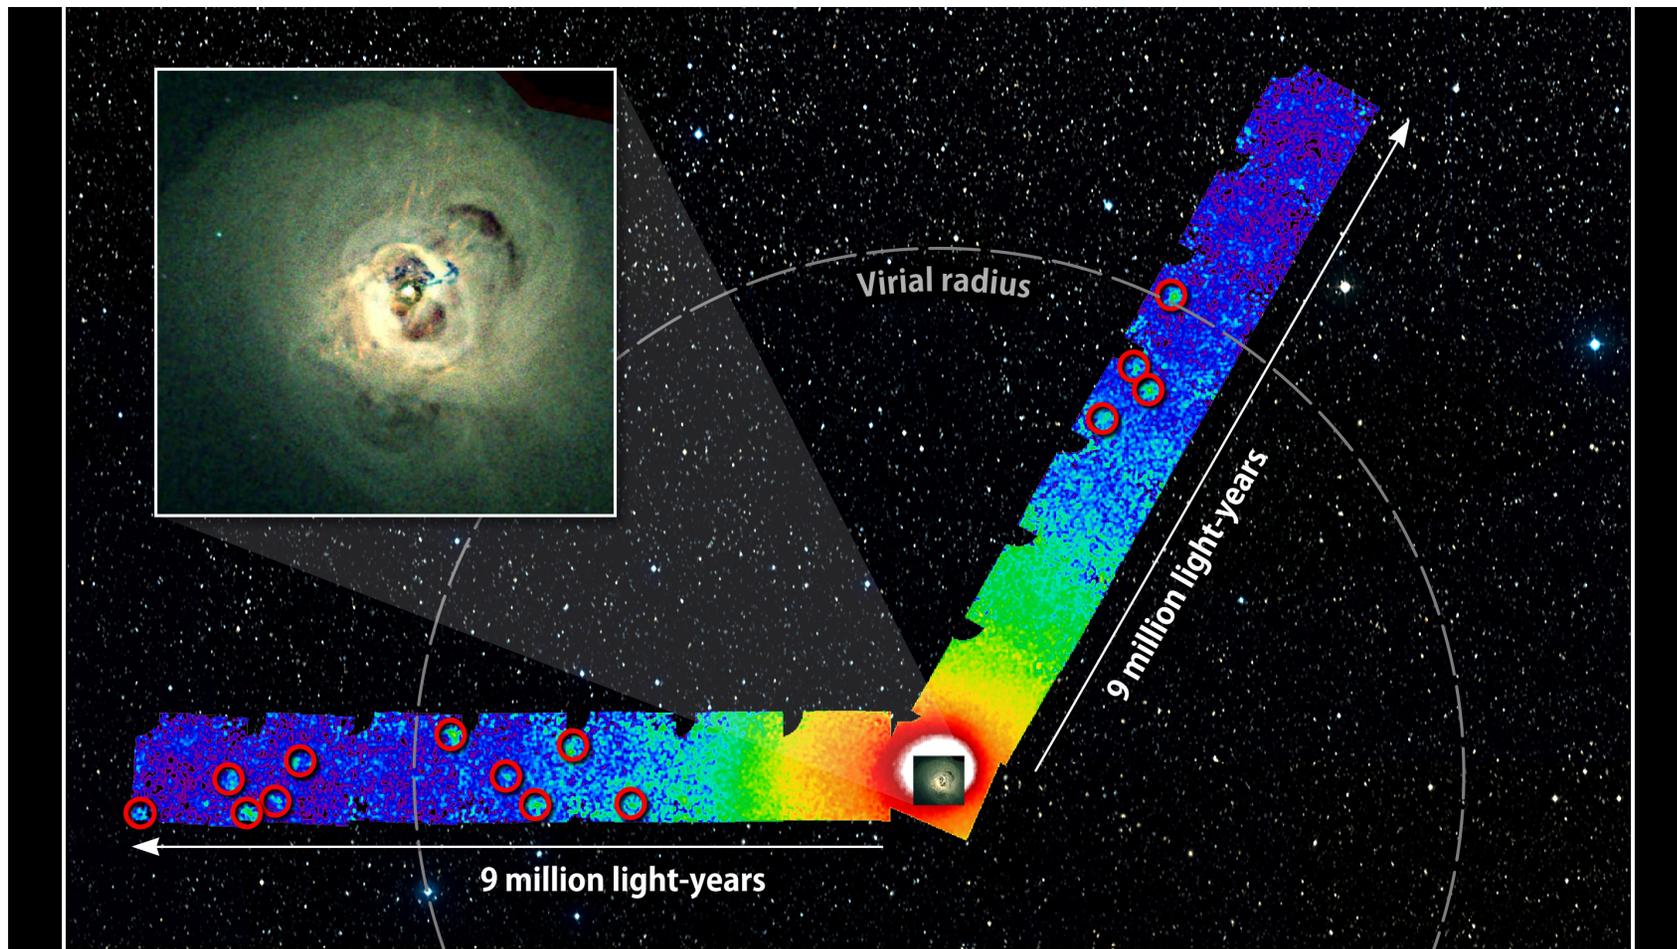

### Bulbul et al. 2014

|                 |  |
|-----------------|--|
| 73 clusters     | XMM-Newton, central regions of clusters only. Up to $z = 0.35$ , including Coma, Perseus |
| Perseus cluster | Chandra, center only   |
| Virgo cluster   | Chandra, center only   |

**Position:** 3.5 keV. Statistical error for line position  $\sim 30$  eV. Systematics ( $\sim 50$  eV – between cameras, determination of known instrumental lines)

**Lifetime:**  $\sim 10^{28}$  sec (uncertainty  $\mathcal{O}(10)$ )

# Perseus galaxy cluster

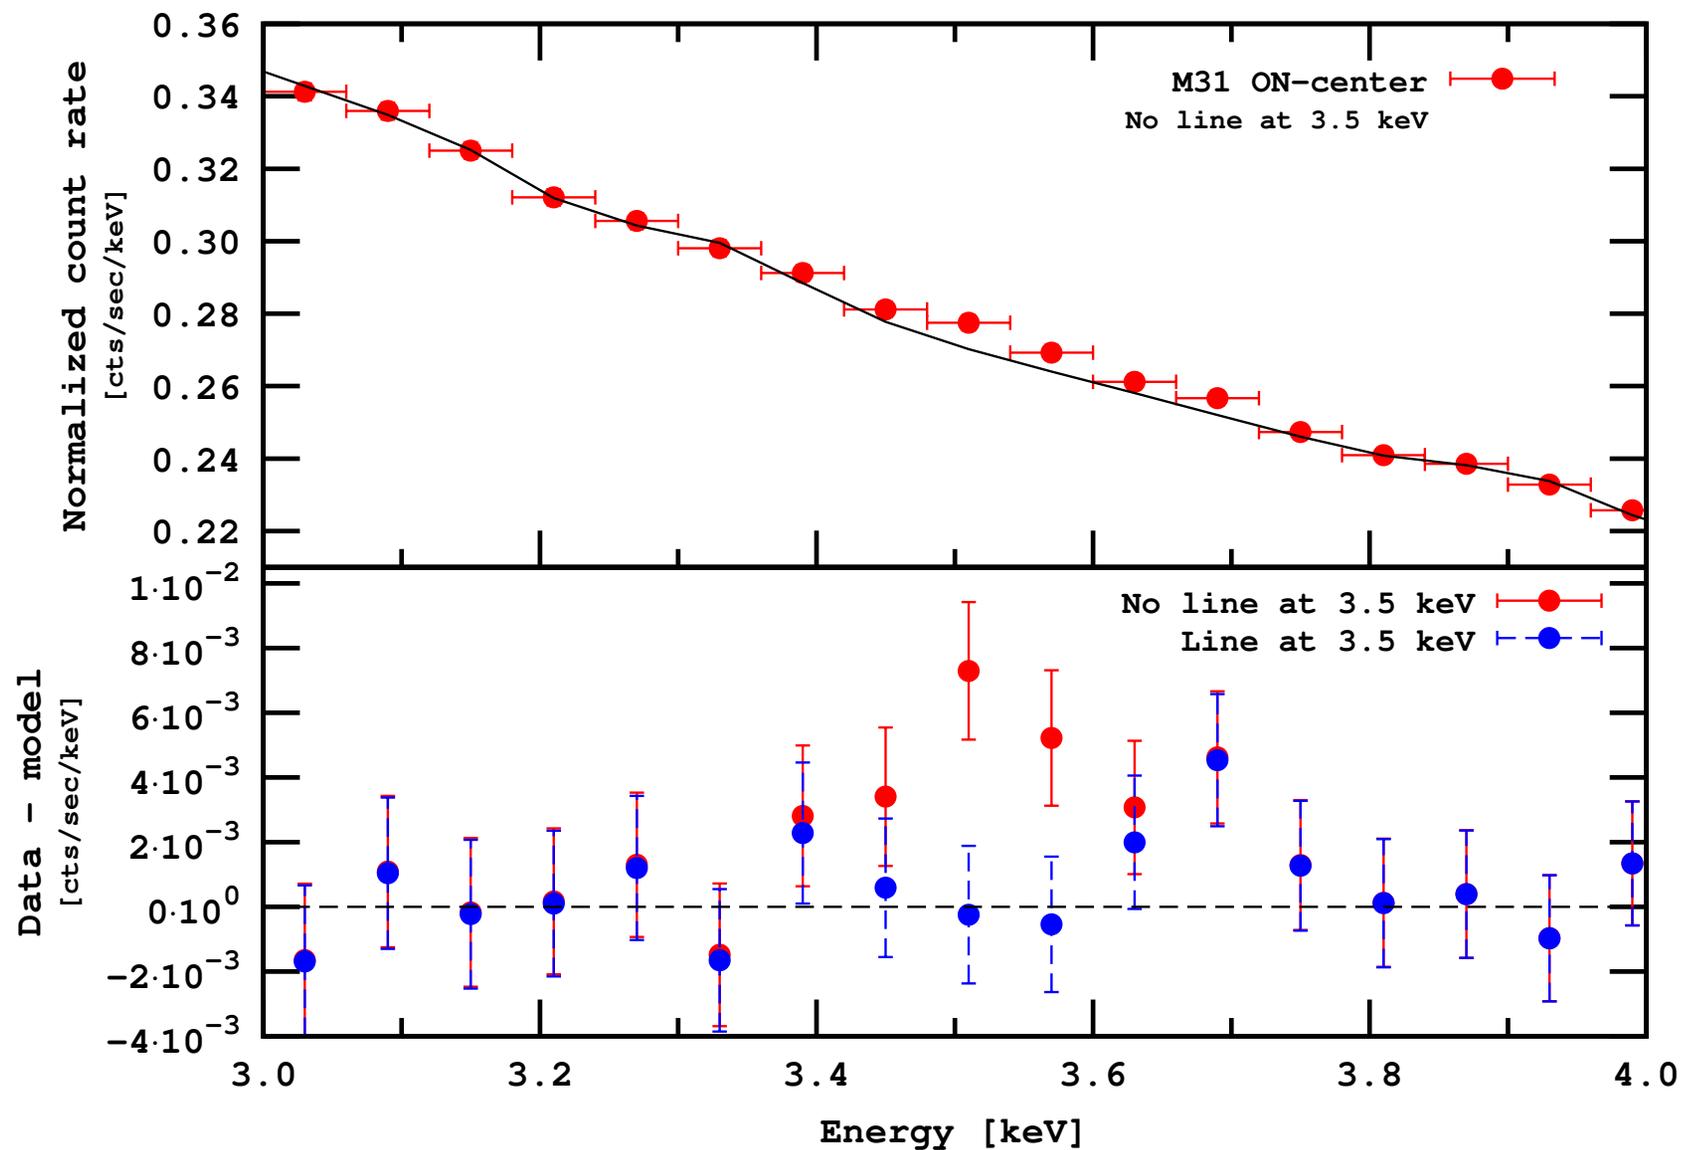

Bulbul et al. took only 2 central XMM observation – 14' around the cluster's center

We took 16 observations **excluding** 2 central XMM observations to avoid modeling complicated central emission

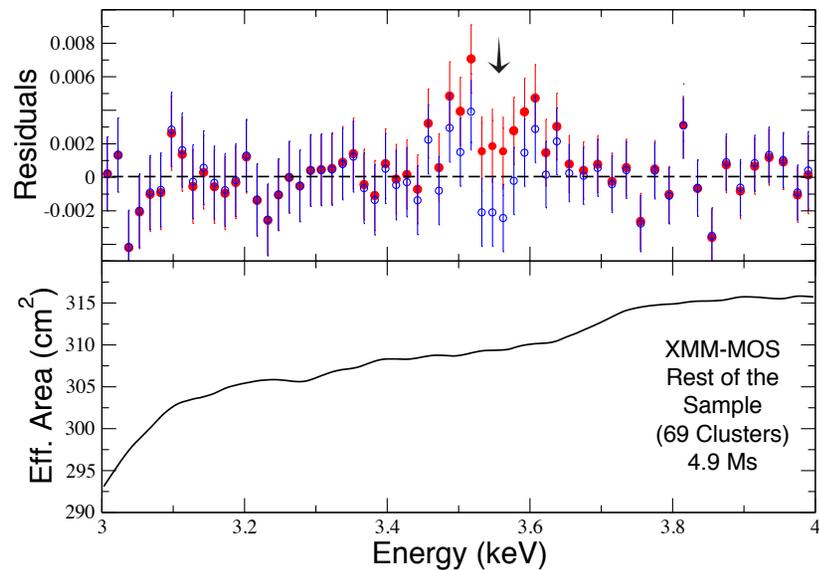

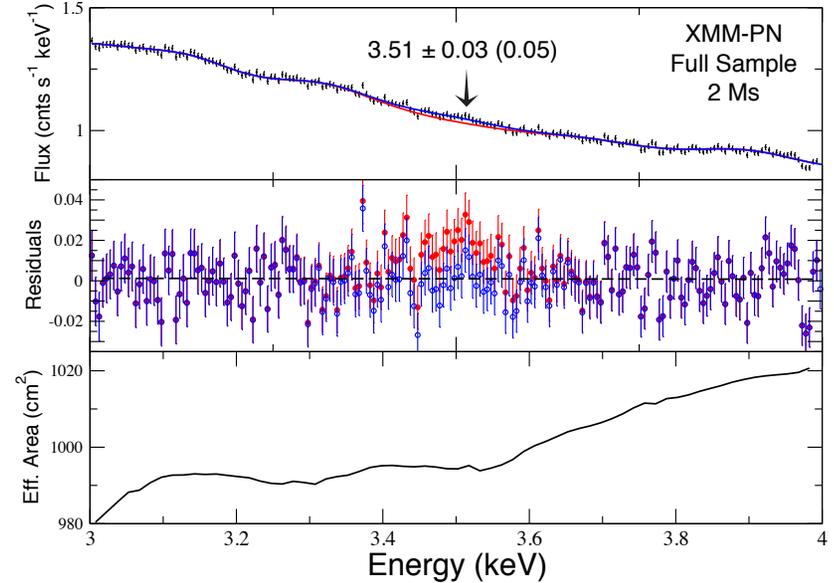

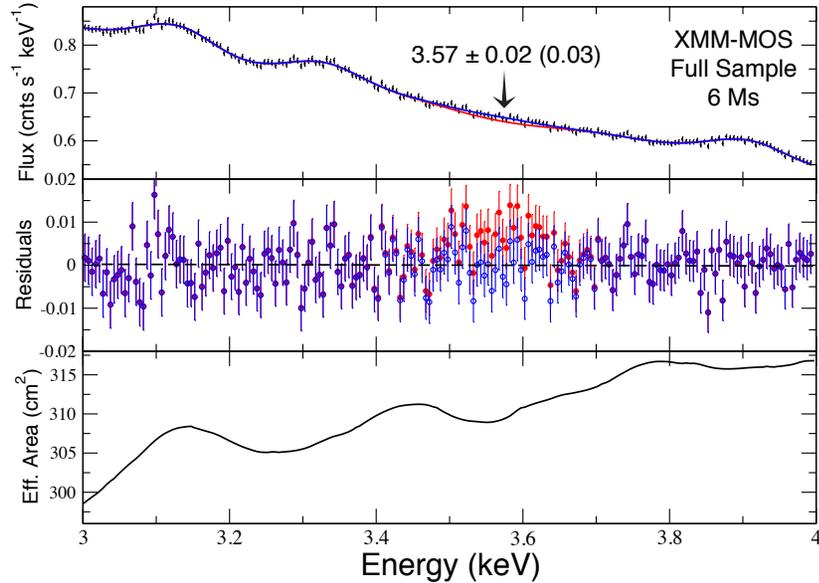

# Andromeda galaxy (zoom 3–4 keV)

[1402.4119]

# Full stacked spectra

Bulbul et al.  
[1402.2301]

- All spectra blue-shifted in the reference frame of clusters
- Instrumental background processed similarly and **subtracted**

## Systematics?

---

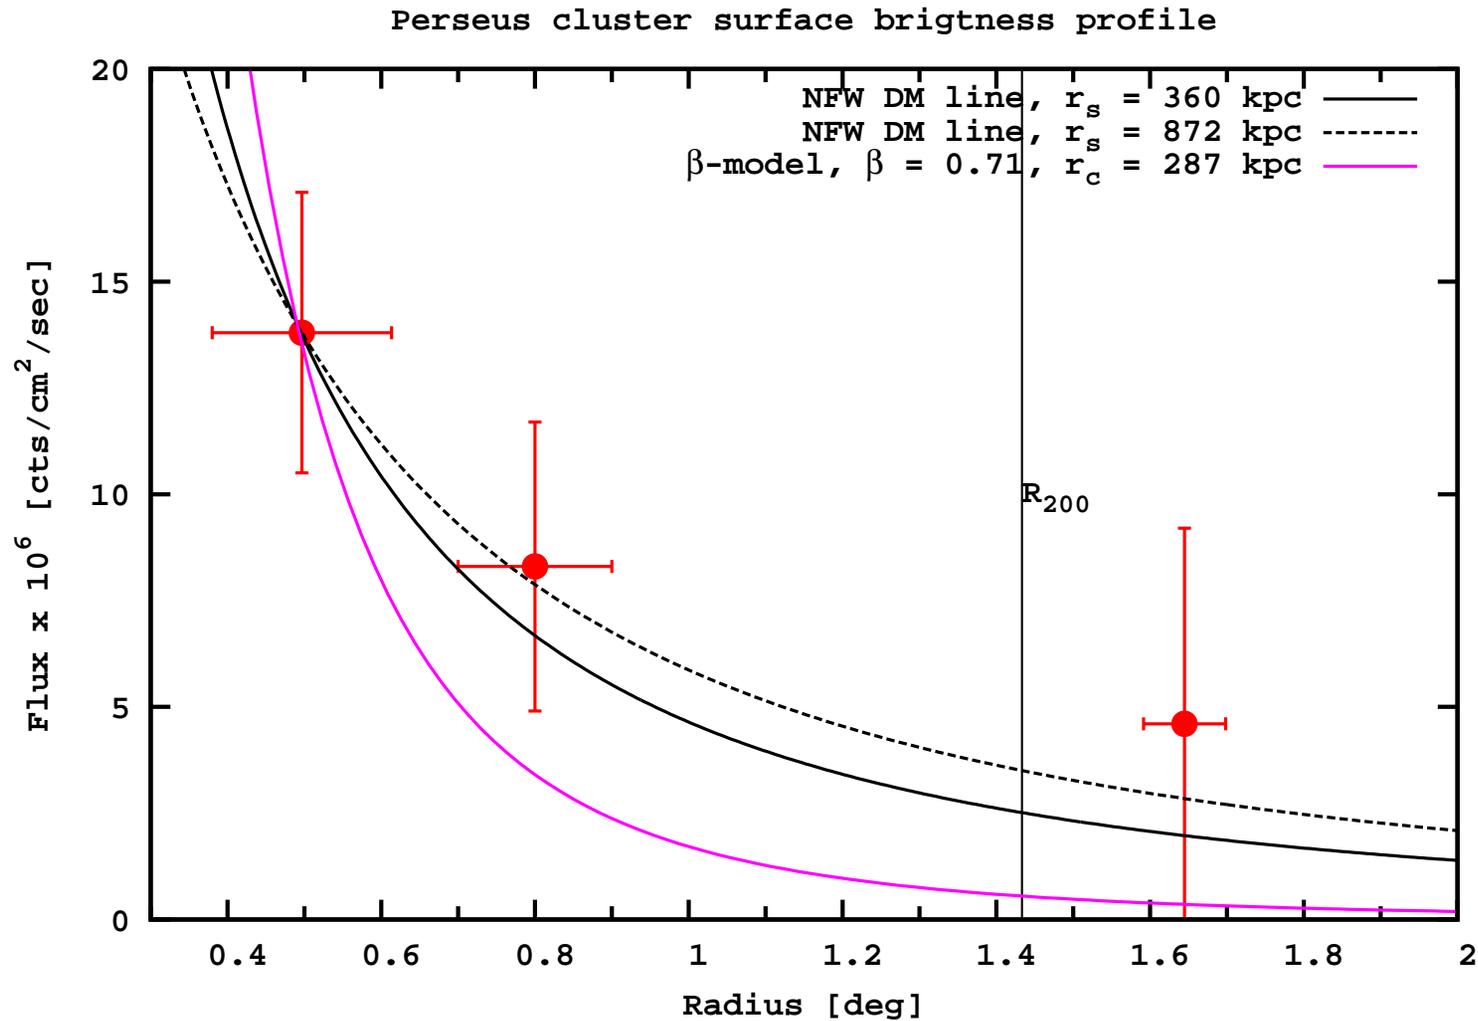

- Detection with two instruments: XMM-Newton and Chandra
- Detection with four detectors: EPIC MOS, EPIC PN, ACIS-S and ACIS-I
- Detection in galaxy clusters (nearby and stacked) and in the Andromeda galaxy
- Correct redshift dependence: stacked clusters (Bulbul et al.) and Perseus vs. M31 (Boyarsky et al.)
- Some unknown effect related to the brightness – No! We have checked bright objects without DM and did not see there a signal
- Wiggle in the effective area?
- Anomalous line brightness?

---

# Dark matter interpretation

# Surface brightness profile (Perseus)

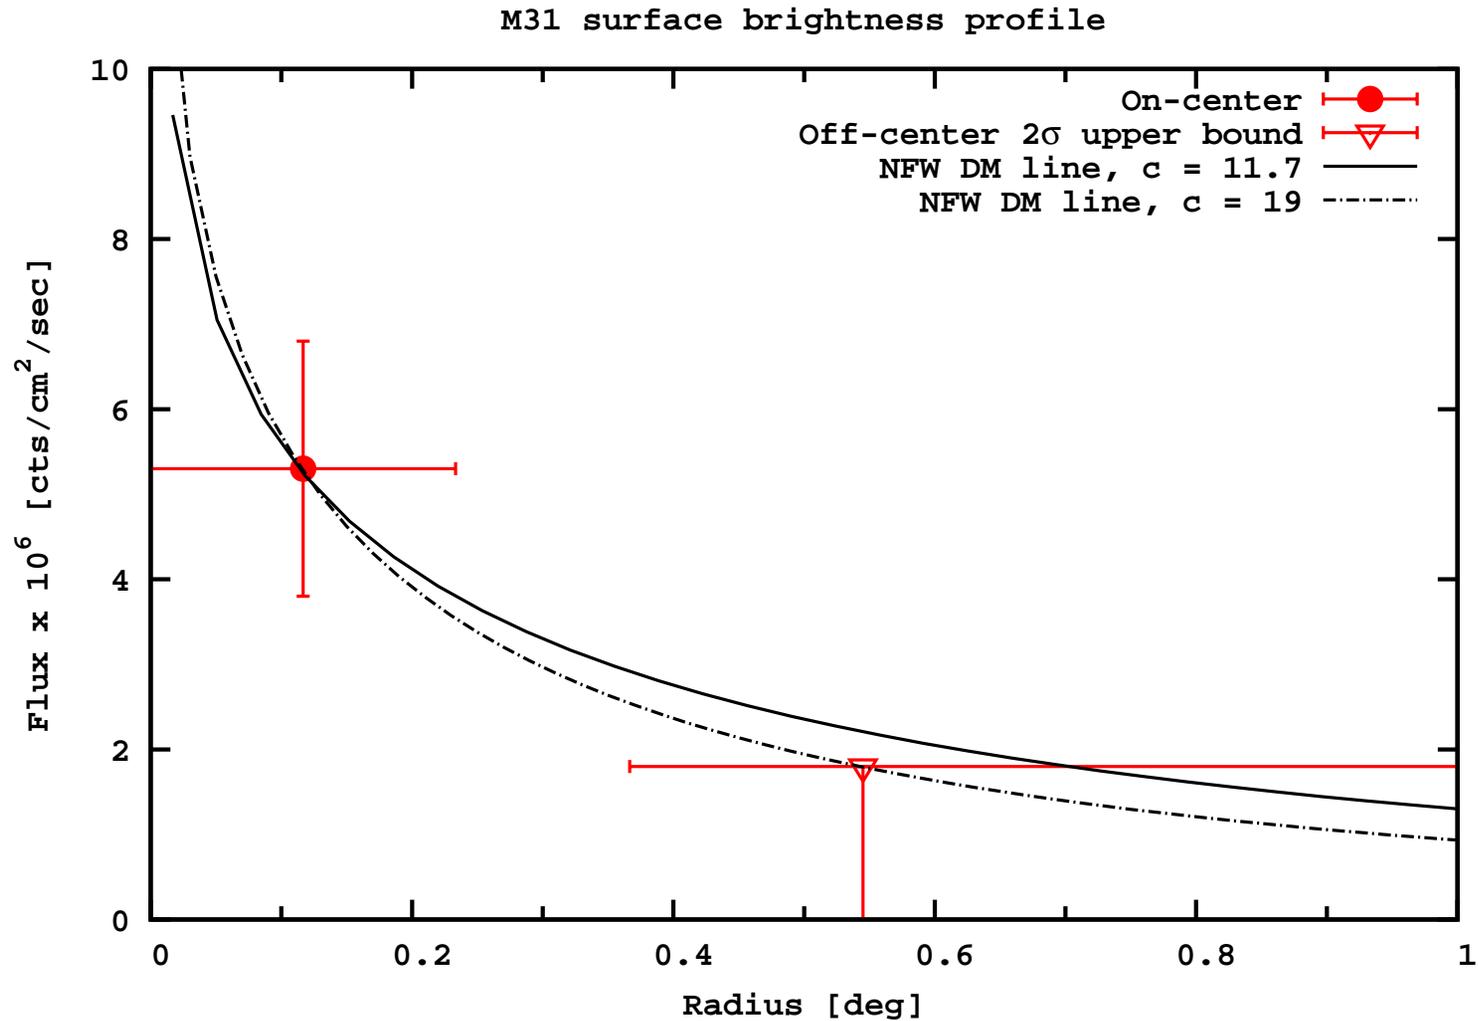

[1402.4119]

This is not a fit!

# Surface brightness profile (M31)

[1402.4119]

This is not a fit!

## Proposal to Search for Heavy Neutral Leptons at the SPS

Expression of Interest. Endorsed by the CERN SPS council

# Expected sensitivity

## Conclusion

---

- We see a weak line in the spectra of many DM-dominated objects (clusters) and Andromeda galaxy
- Line does not have obvious systematic interpretation, observed with 4 different detectors
- If this is 7 keV sterile neutrino – its production requires significant lepton asymmetry present in the Universe below sphaleron freeze-out temperature
- Particles, responsible for production of such lepton asymmetry can be found at beam dump experiment (**SHiP** – **S**earch for **H**idden **P**articles)
- For such a sterile neutrino we should see some imprints in the formation of the structures in the recent Universe

Future? Looks exciting!

# Resonant enhancement

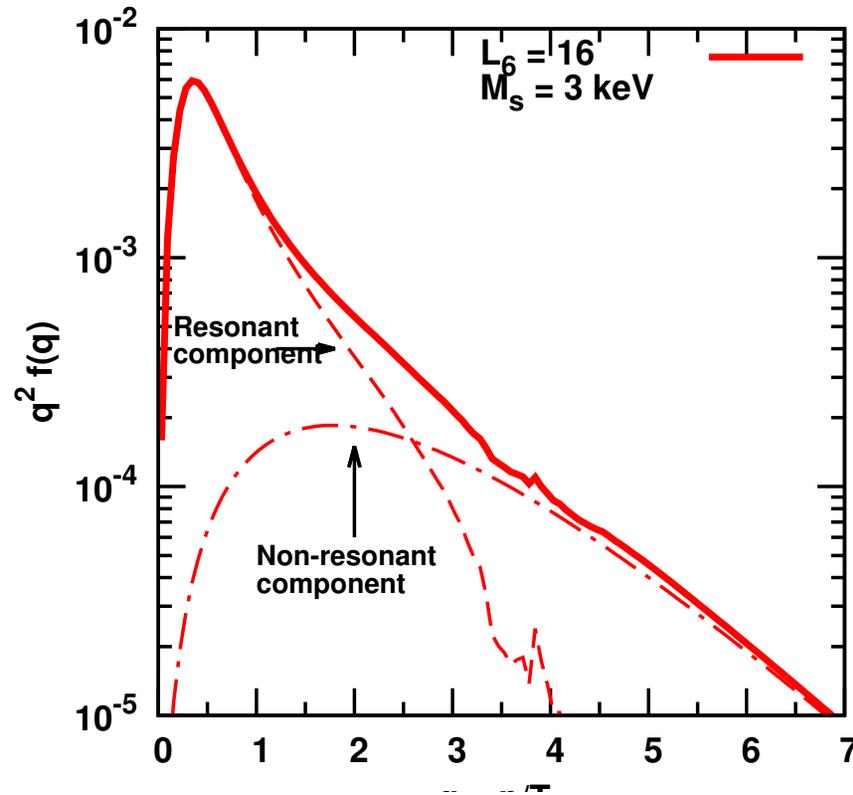

Conversion of  $\nu$  to  $N$  is enhanced whenever “levels” cross and virtual neutrino goes “on-shell” (analog of MSW effect but for active-sterile mixing)

Shi & Fuller  
[astro-ph/9810076]

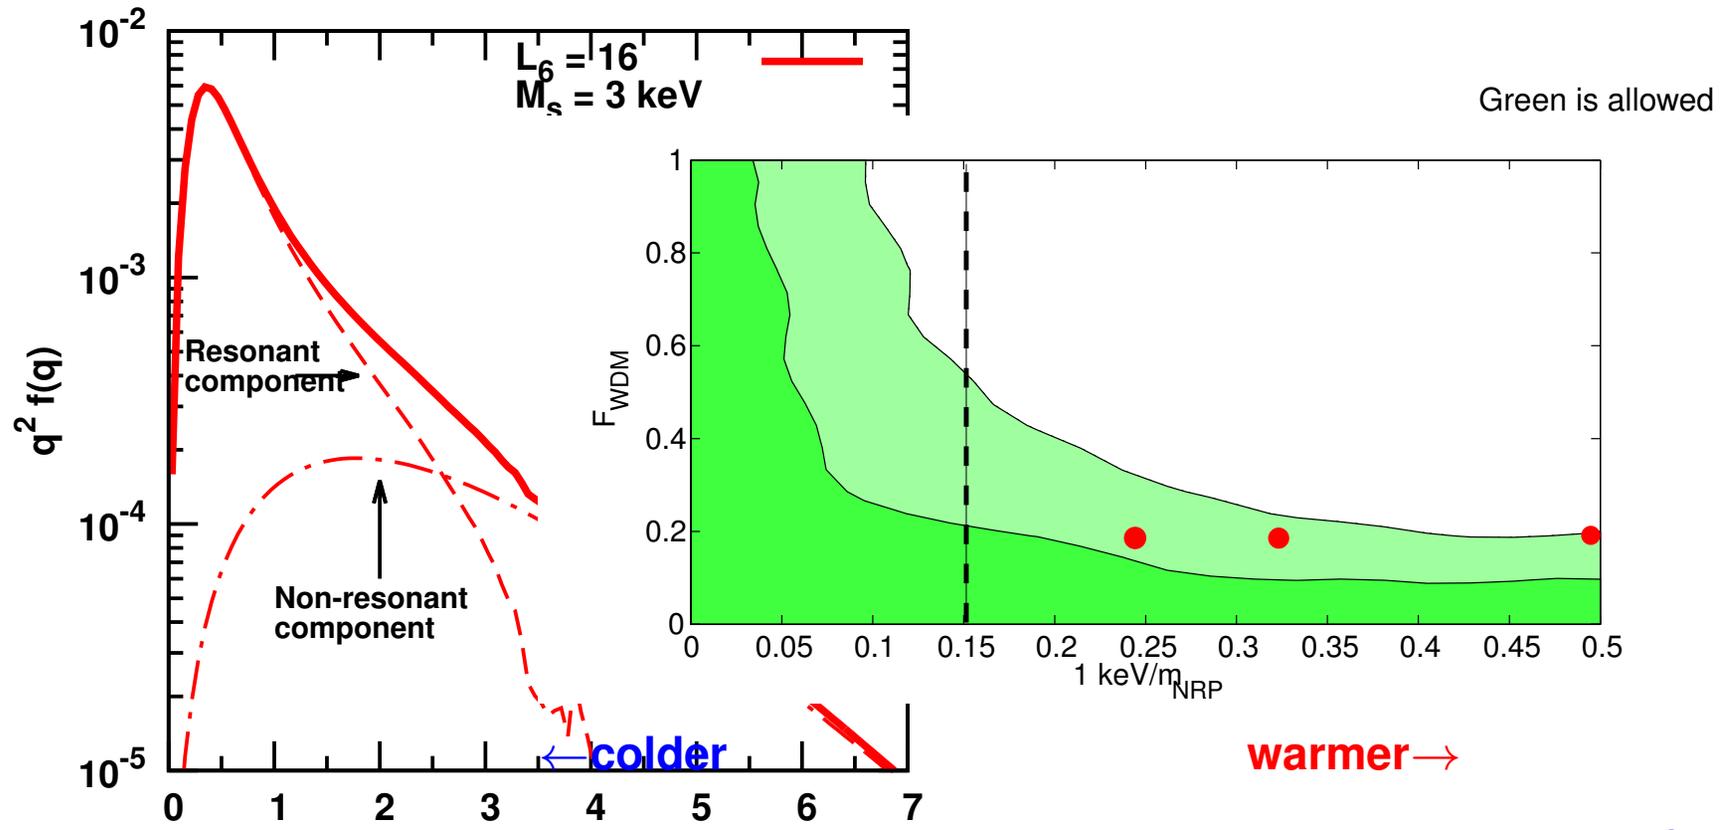

Laine & Shaposhnikov  
[0804.4543]

## Resonant enhancement

- In the presence of **large lepton asymmetry** the **MSW resonance** can take place and production of sterile neutrinos becomes much more effective
- The condition for resonance occurs only for specific values of momentum  $p$  and during limited period of time.
- For sterile neutrinos  $p \gg M$  at production

# Structure formation

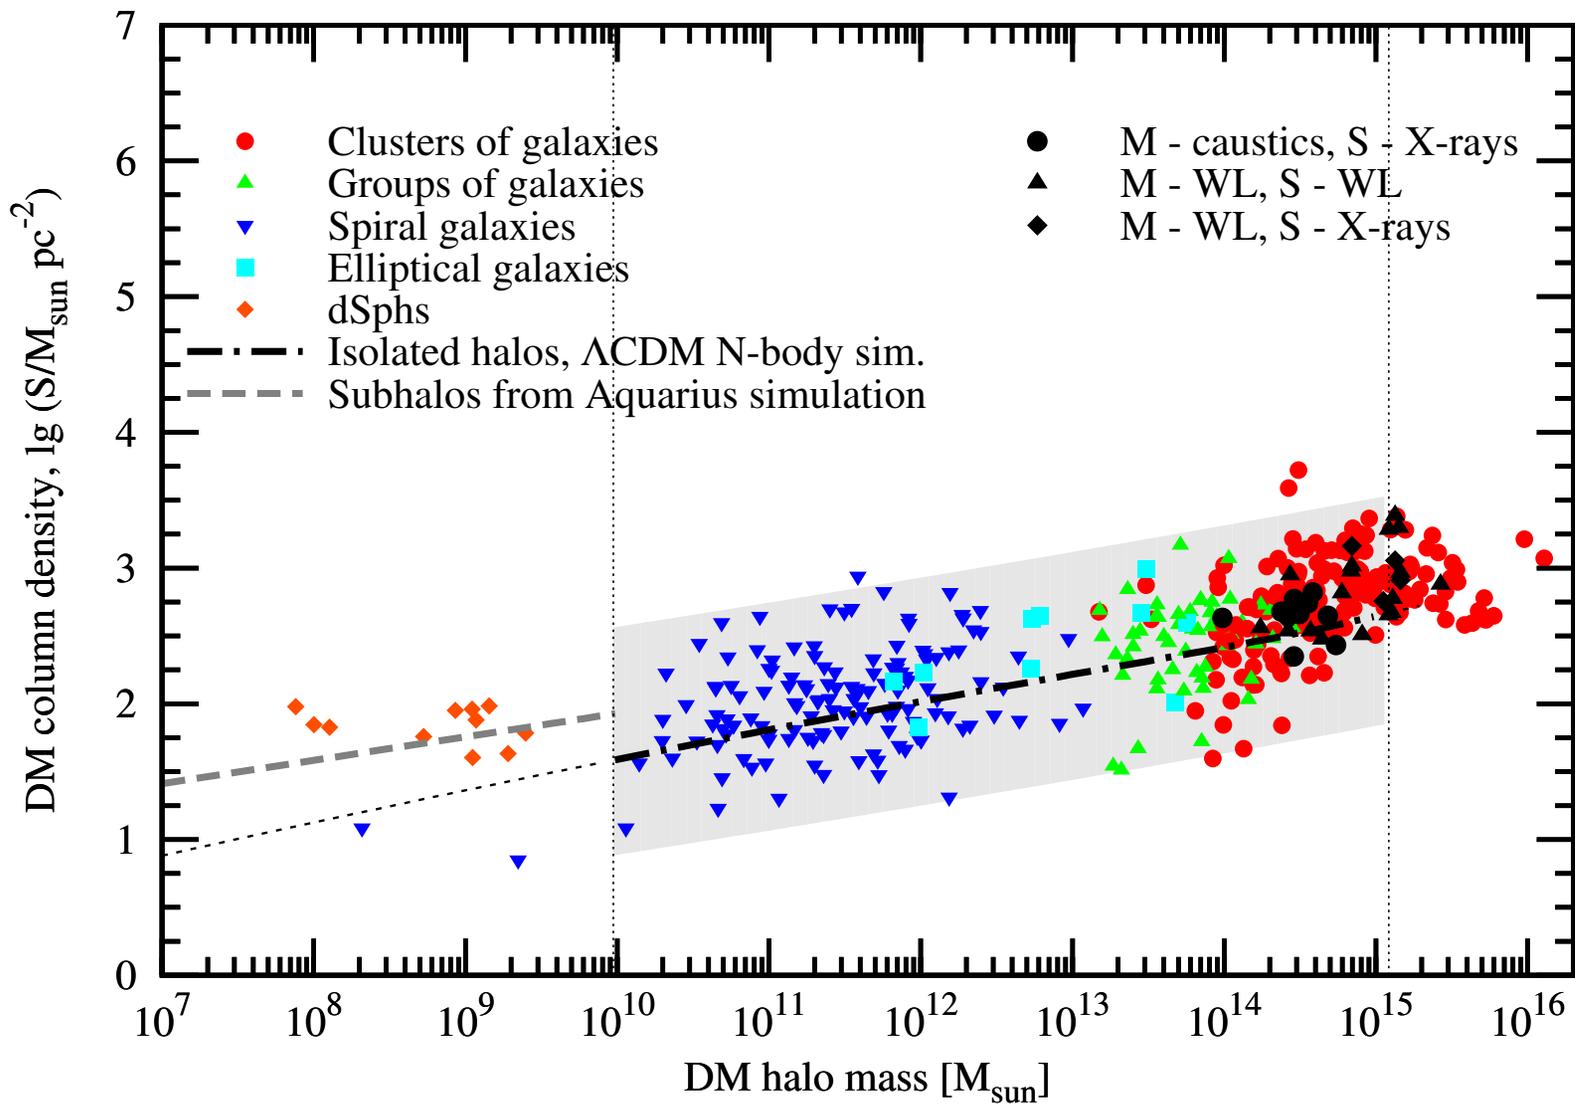

O.R. with  
 A. Boyarsky et  
 al. 2008-2009

- About  $\sim 60\%$  of 7 keV sterile neutrino can be **rather warm**
- Such sterile neutrino can leave noticeable traces on the halo structure

# Signal from different DM-dominated objects

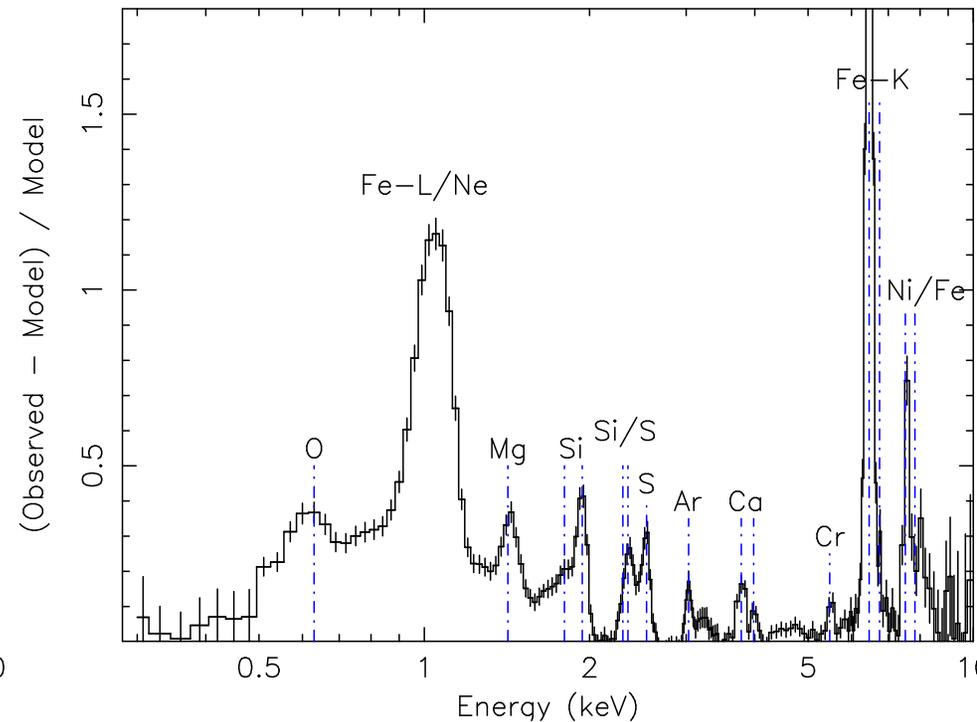

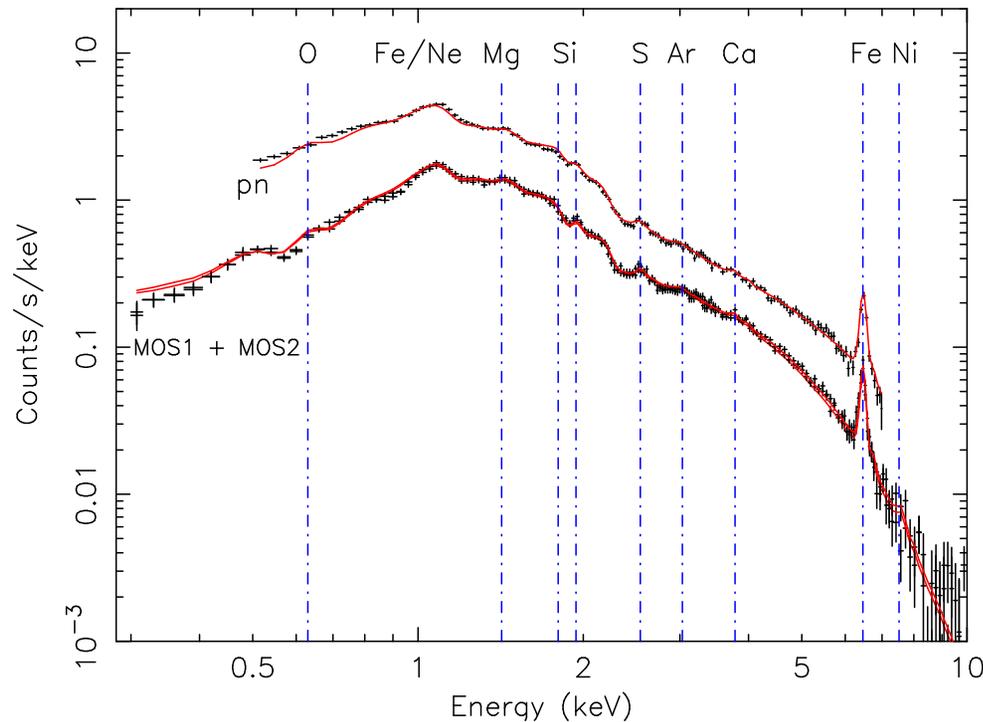

Boyarsky, O.R.  
et al. PRL'09

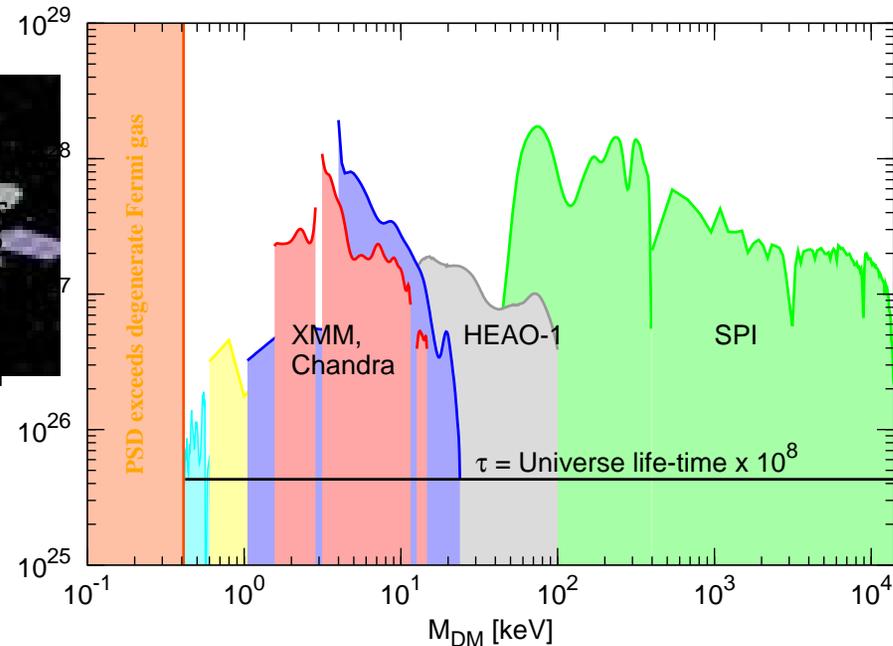

# Why clusters do not obviously win?

- Virial theorem:  $k_B T \sim \frac{G_N M}{D}$  or  $T \sim 10 \text{ keV} \left( \frac{\text{Overdensity}}{10^3} \right) \left( \frac{\text{Size}}{\text{Mpc}} \right)$

# Astro-H: better spectral resolution

[1402.2301]

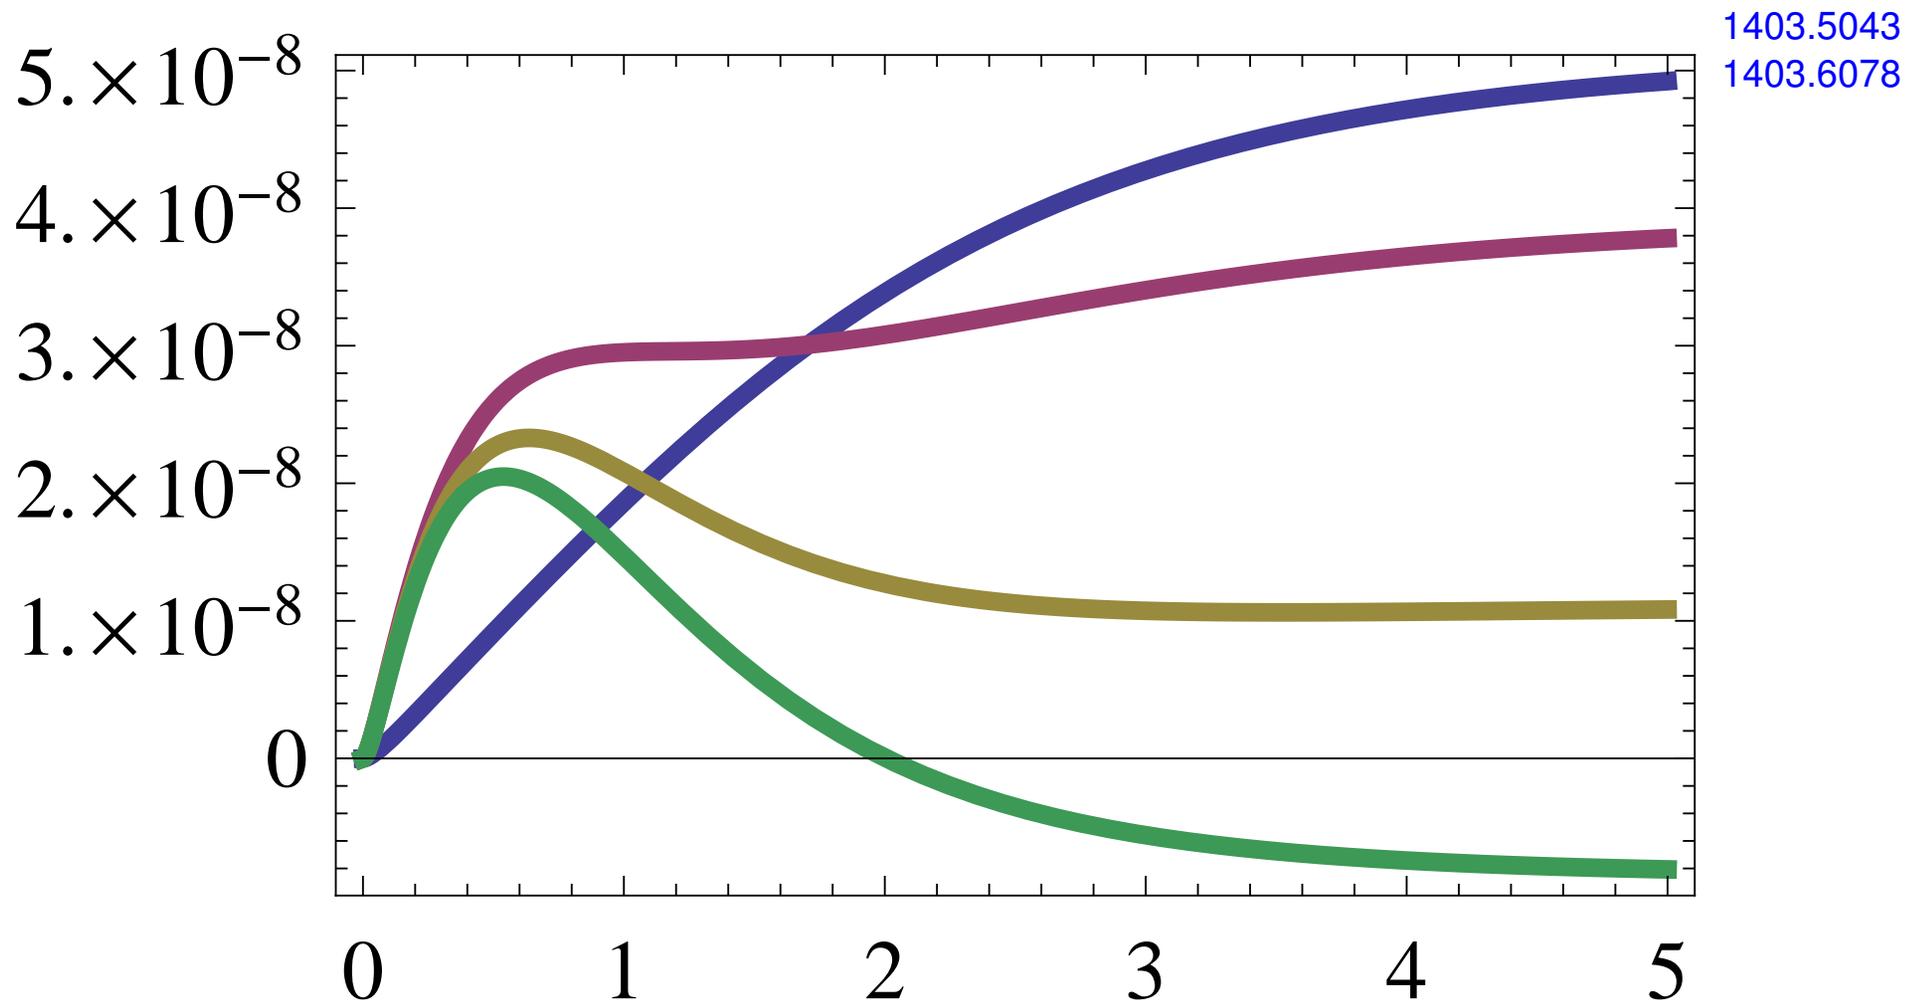

# Wiggle in the effective area?

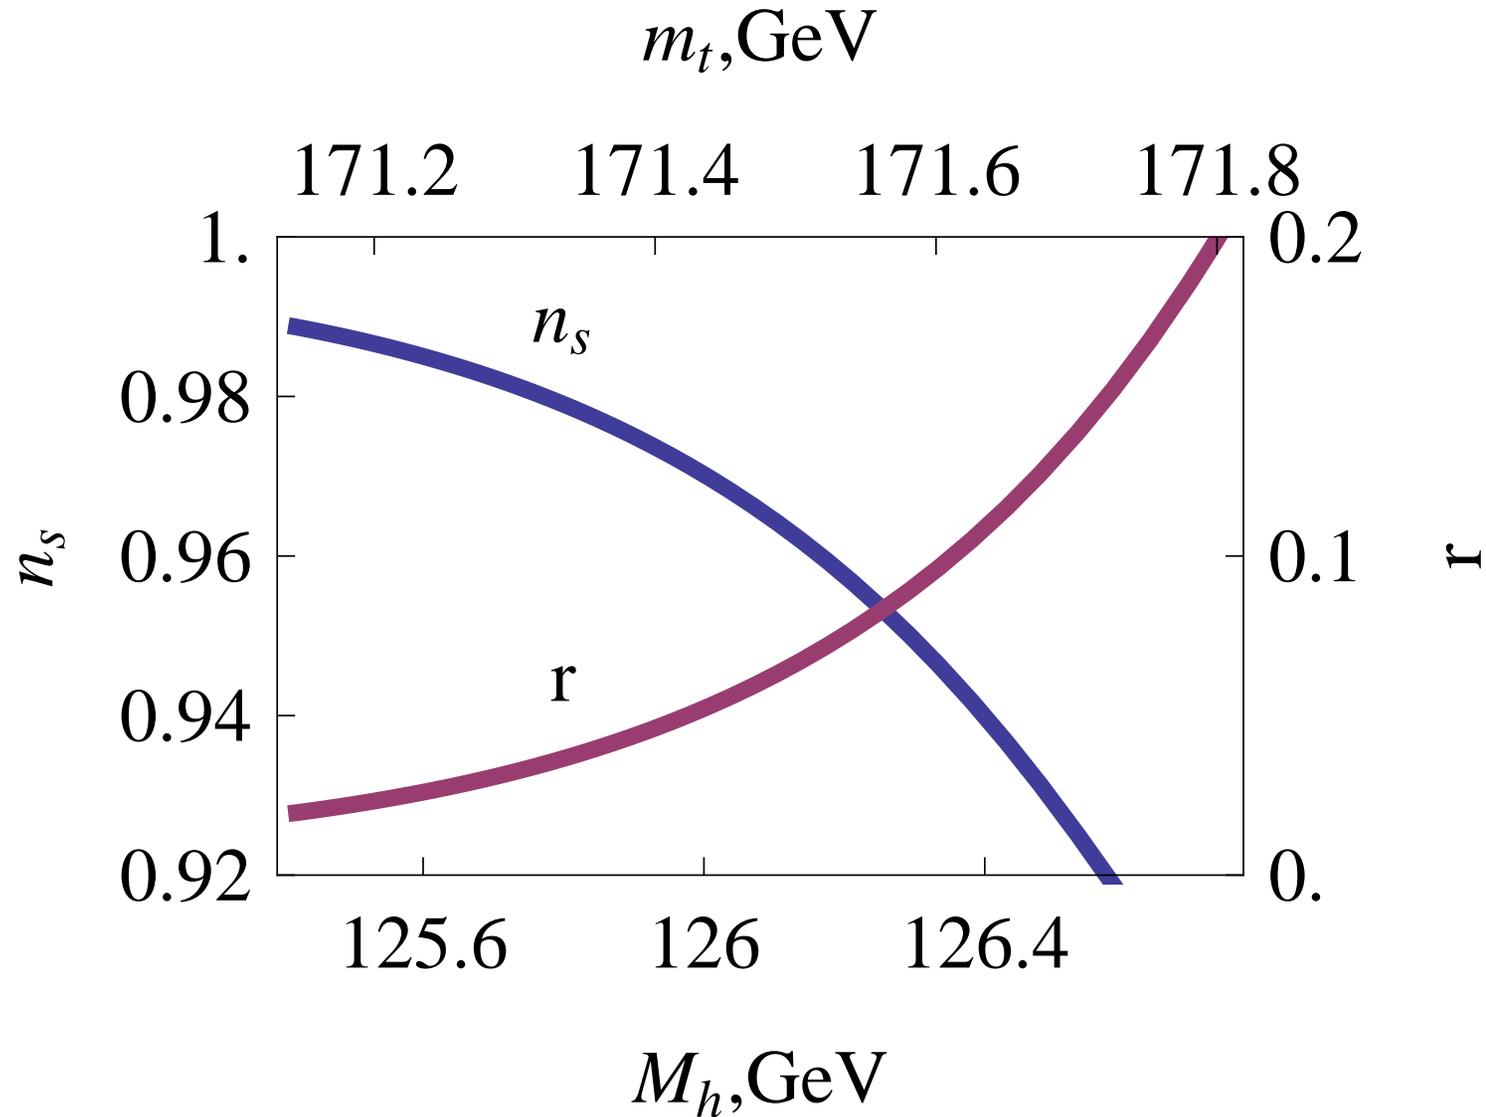

Bulbul et al.  
[1402.2301]

- Easiest way to get a weak line: Divide a powerlaw signal by an effective area with a dip at  $\sim 3.5$  keV
- Wiggle is not present in the stacked redshifted dataset but the signal is (Bulbul et al.)
- Wiggle would cause a signal in the blank sky data (Boyarsky, O.R. et al.)
