Conclusions

- Cold Dark Matter “DM-only” simulations are well converged across different codes. WDM simulations are more problematic, but solutions are on the way ... watch this space!
- Including models for baryons in the Universe can, in principle, significantly alter the results from structure formation simulations:
 - Triaxial “halos” \Rightarrow Oblate/round halos.
 - Cuspy dark matter profiles \Rightarrow Cored dark matter profiles.
 - Cored halos are more easily tidally disrupted \Rightarrow Fewer satellites.
 - An existing stellar disc \Rightarrow An accreted “dark disc”.
- WDM is becoming increasingly constrained. Latest Ly-alpha measurements $\Rightarrow M_{\text{WDM}} > 3.3 \text{ keV}/c^2$ [thermal]
- The observed distribution of DM agrees with “DM-only” simulations only on the very largest scales.
