

Introduction to

python

Why Python?

Highly expressive:

```
friends = ['john', 'pat', 'gary', 'michael']
for i, name in enumerate(friends):
    print("iteration {iteration} is {name}".format(iteration=i, name=name))
```

Object oriented

Ease:

Easy to learn, change from IDL or Matlab.

Very active community

Extendability:

libraries for numerics, data analysis, plotting, financing, ...

Interoperability:

Import IDL and Matlab code.

“But all my routines are written in IDL.”

update U V data for matplotlib.streamplot

3

1

After plotting streamlines using 'matplotlib.streamplot' I need to change the U V data and update plot. For imshow and quiver there are the functions 'set_data' and 'set_UVC', respectively. There does not seem to be any similar function for streamlines. Is there any way to still updateget sim functionality?

python matplotlib scipy

3 I suspect the answer is no, because if you change the vectors, it would need to re-compute the streamlines. The objects returned by `streamline` are a line and patch collections, which know nothing about the streamlines. To get this functionality would require writing a new class to wrap everything up and in a sensible way to re-use the existing objects. – [tacaswell](#) Dec 24 '12 at 17:31

1 A dirty workaround would be setting the visibility of the arrows and lines to 0 and then plotting the new streamlines. Will try if that is fast enough, since speed is an issue. – [lomsn](#) Dec 25 '12 at 0:06 ↗

1 Works for the lines, but not for the arrows. – [lomsn](#) Dec 25 '12 at 0:21

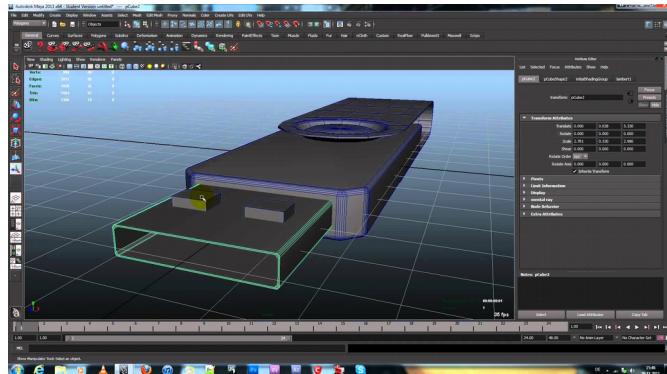

An improvement over your current workaround, if you only have the streamplot on your axes object, is call `ax.cla()`, and then call `ax.streamplot(U_new, V_new)`. – [dmcdougall](#) Apr 2 '13 at 1:21

Editor - C:\Users\Steve\xy\fresnel\fresnel.py Object inspector

Source Console Object fresnel.fresnel_main

fresnel_main(pol, n_list, d_list, th_0, lam_vac)

Main fresnel calc. Given parameters of a stack, calculates everything you could ever want to know about how light propagates in it. (If performance is an issue, you can delete some of the calculations without affecting the rest.)

pol is light polarization, "s" or "p".

n_list is the list of refractive indices, in the order that the light would pass through them. The 0'th element of the list should be the semi-infinite medium from which the light enters, the last element should be the semi-infinite medium to which the light exits (if any exists).

th_0 is the angle of incidence 0 for normal, pi/2 for glancing. Remember, for a dissipative incoming medium ($n_{list}[0]$ is not real), th_0 should be complex so that $n_0 \sin(\text{th}_0)$ is real (intensity is constant as a function of lateral position).

d_list is the list of layer thicknesses (front to back). Should correspond one-to-one with elements of n_list. First and last elements should be "inf".

lam_vac is vacuum wavelength of the light.
