Star formation and feedback at z~2

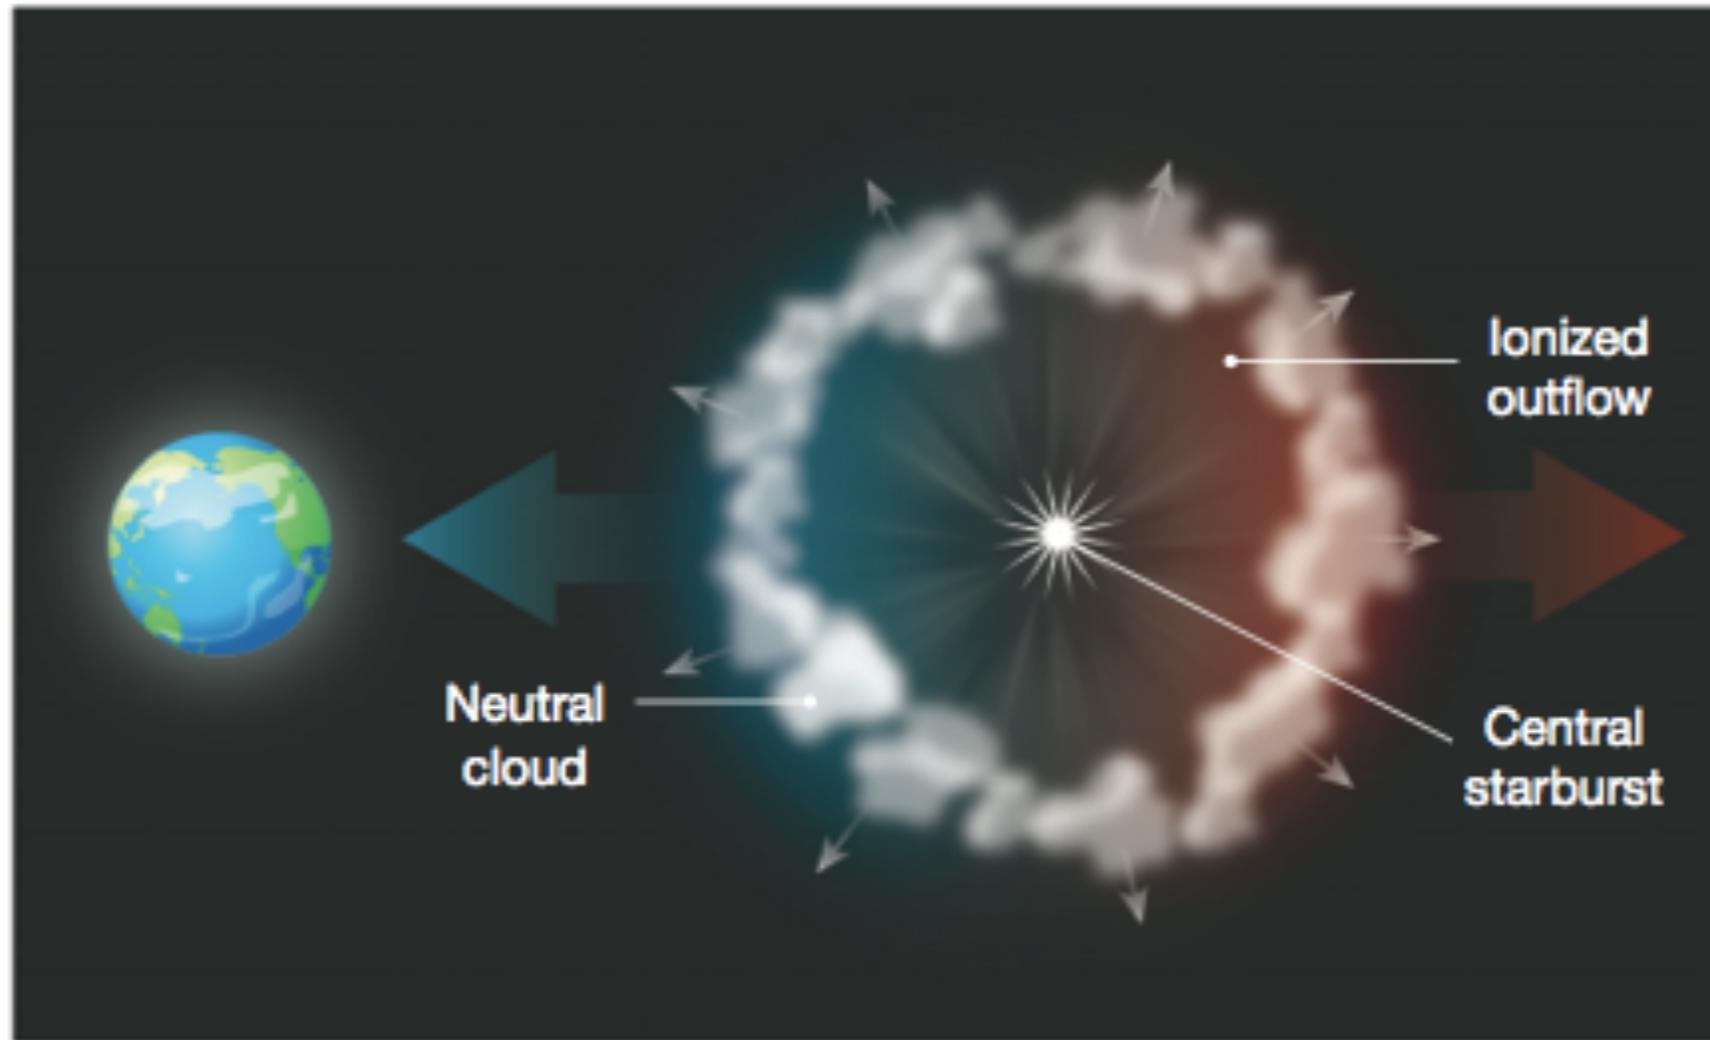

Feedback in low mass galaxies

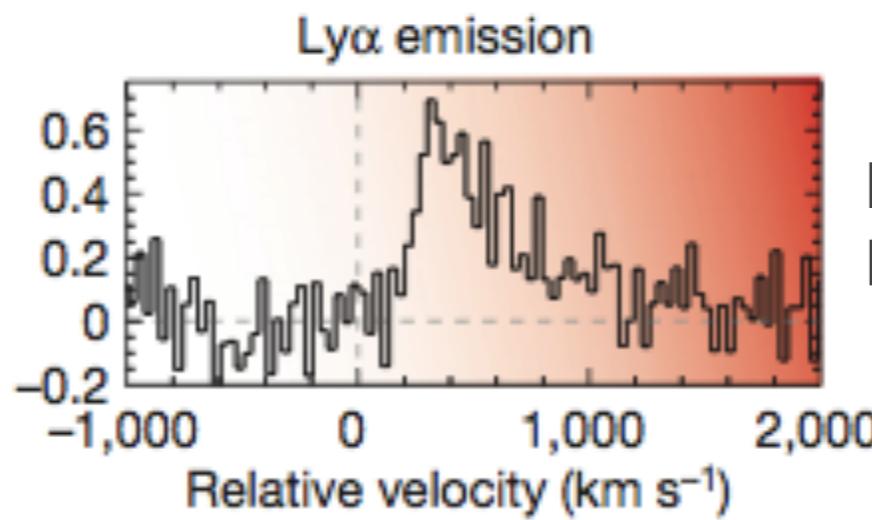

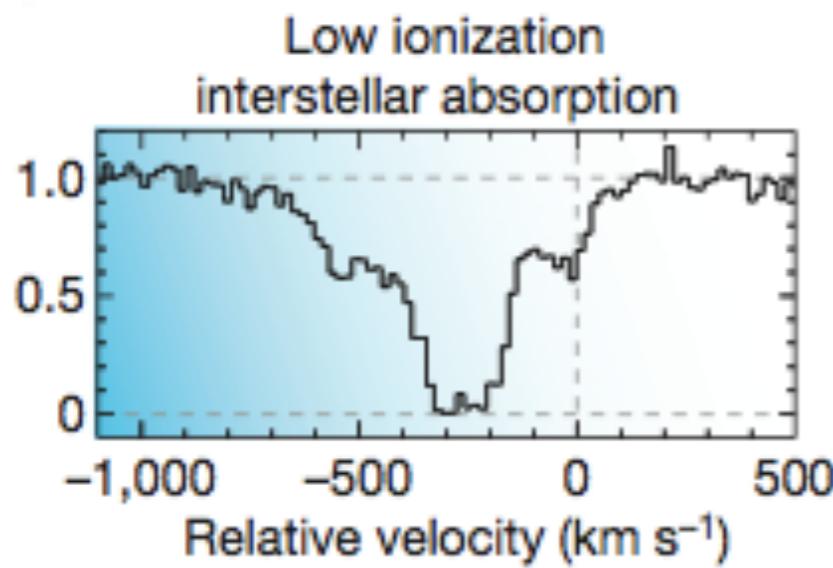

Low mass galaxies (probably) reionized the universe

Galactic outflows ubiquitous at high redshifts

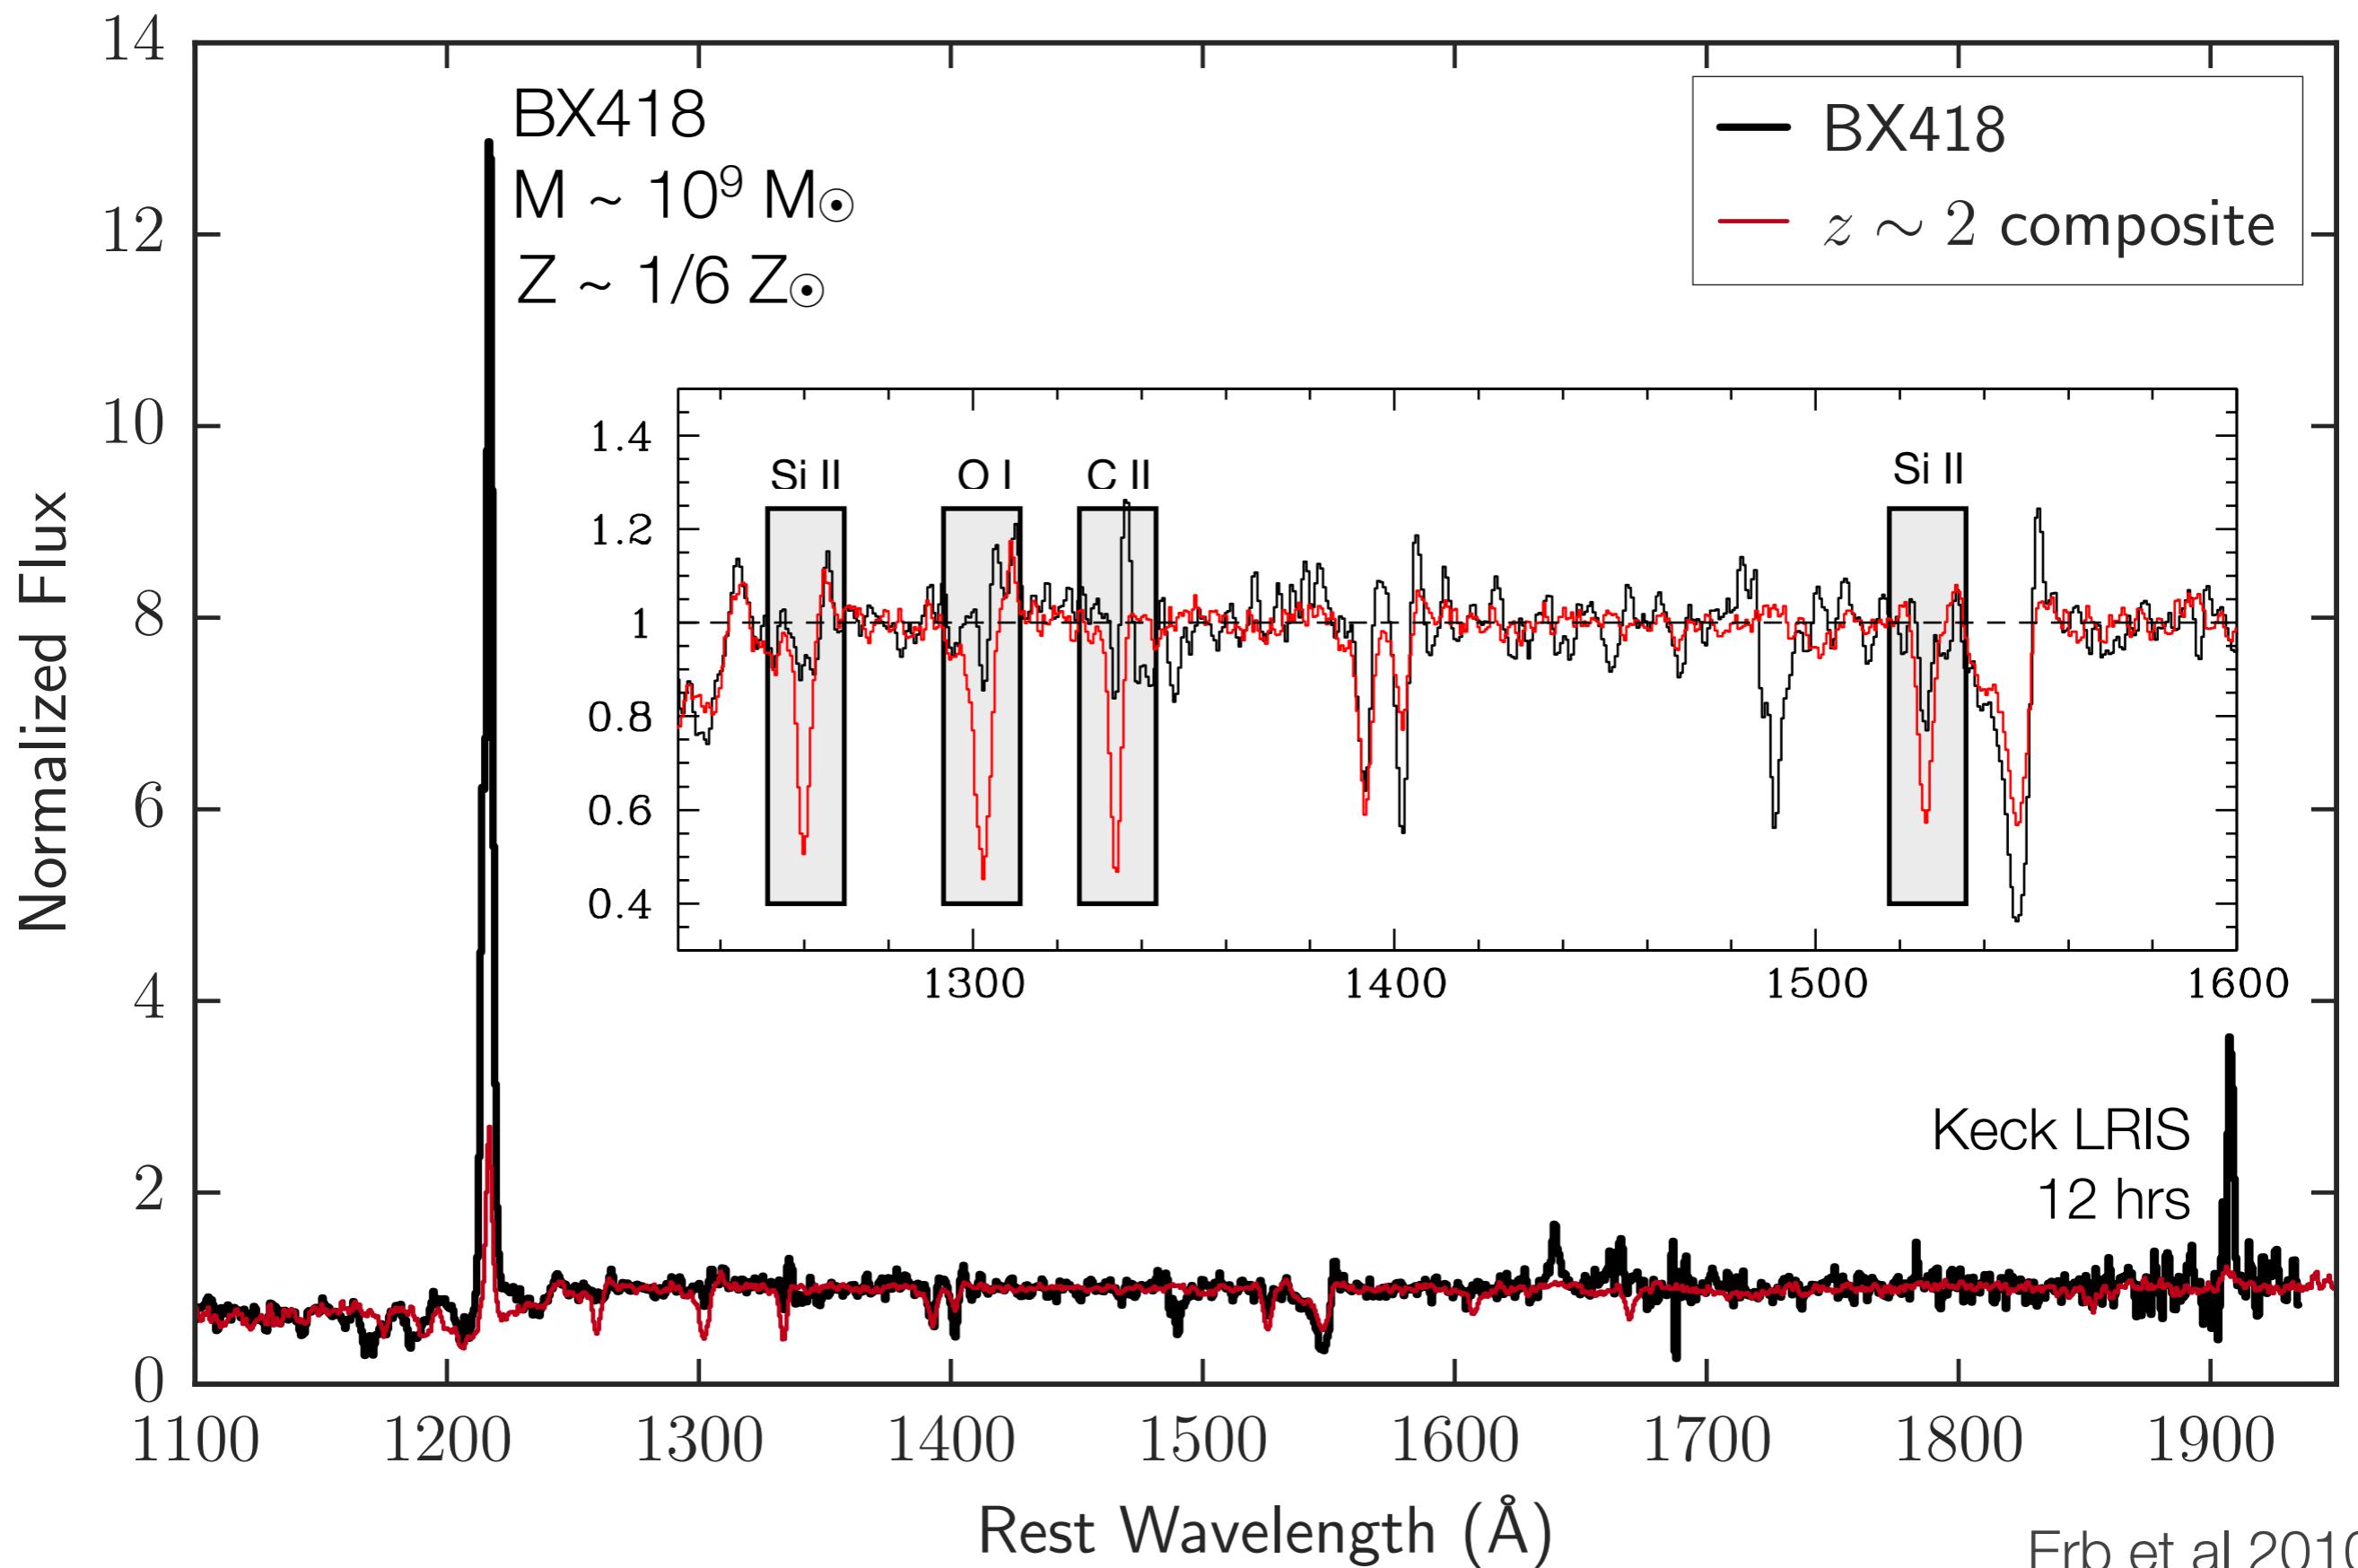

What are the properties of galactic outflows in low mass galaxies at high redshifts?

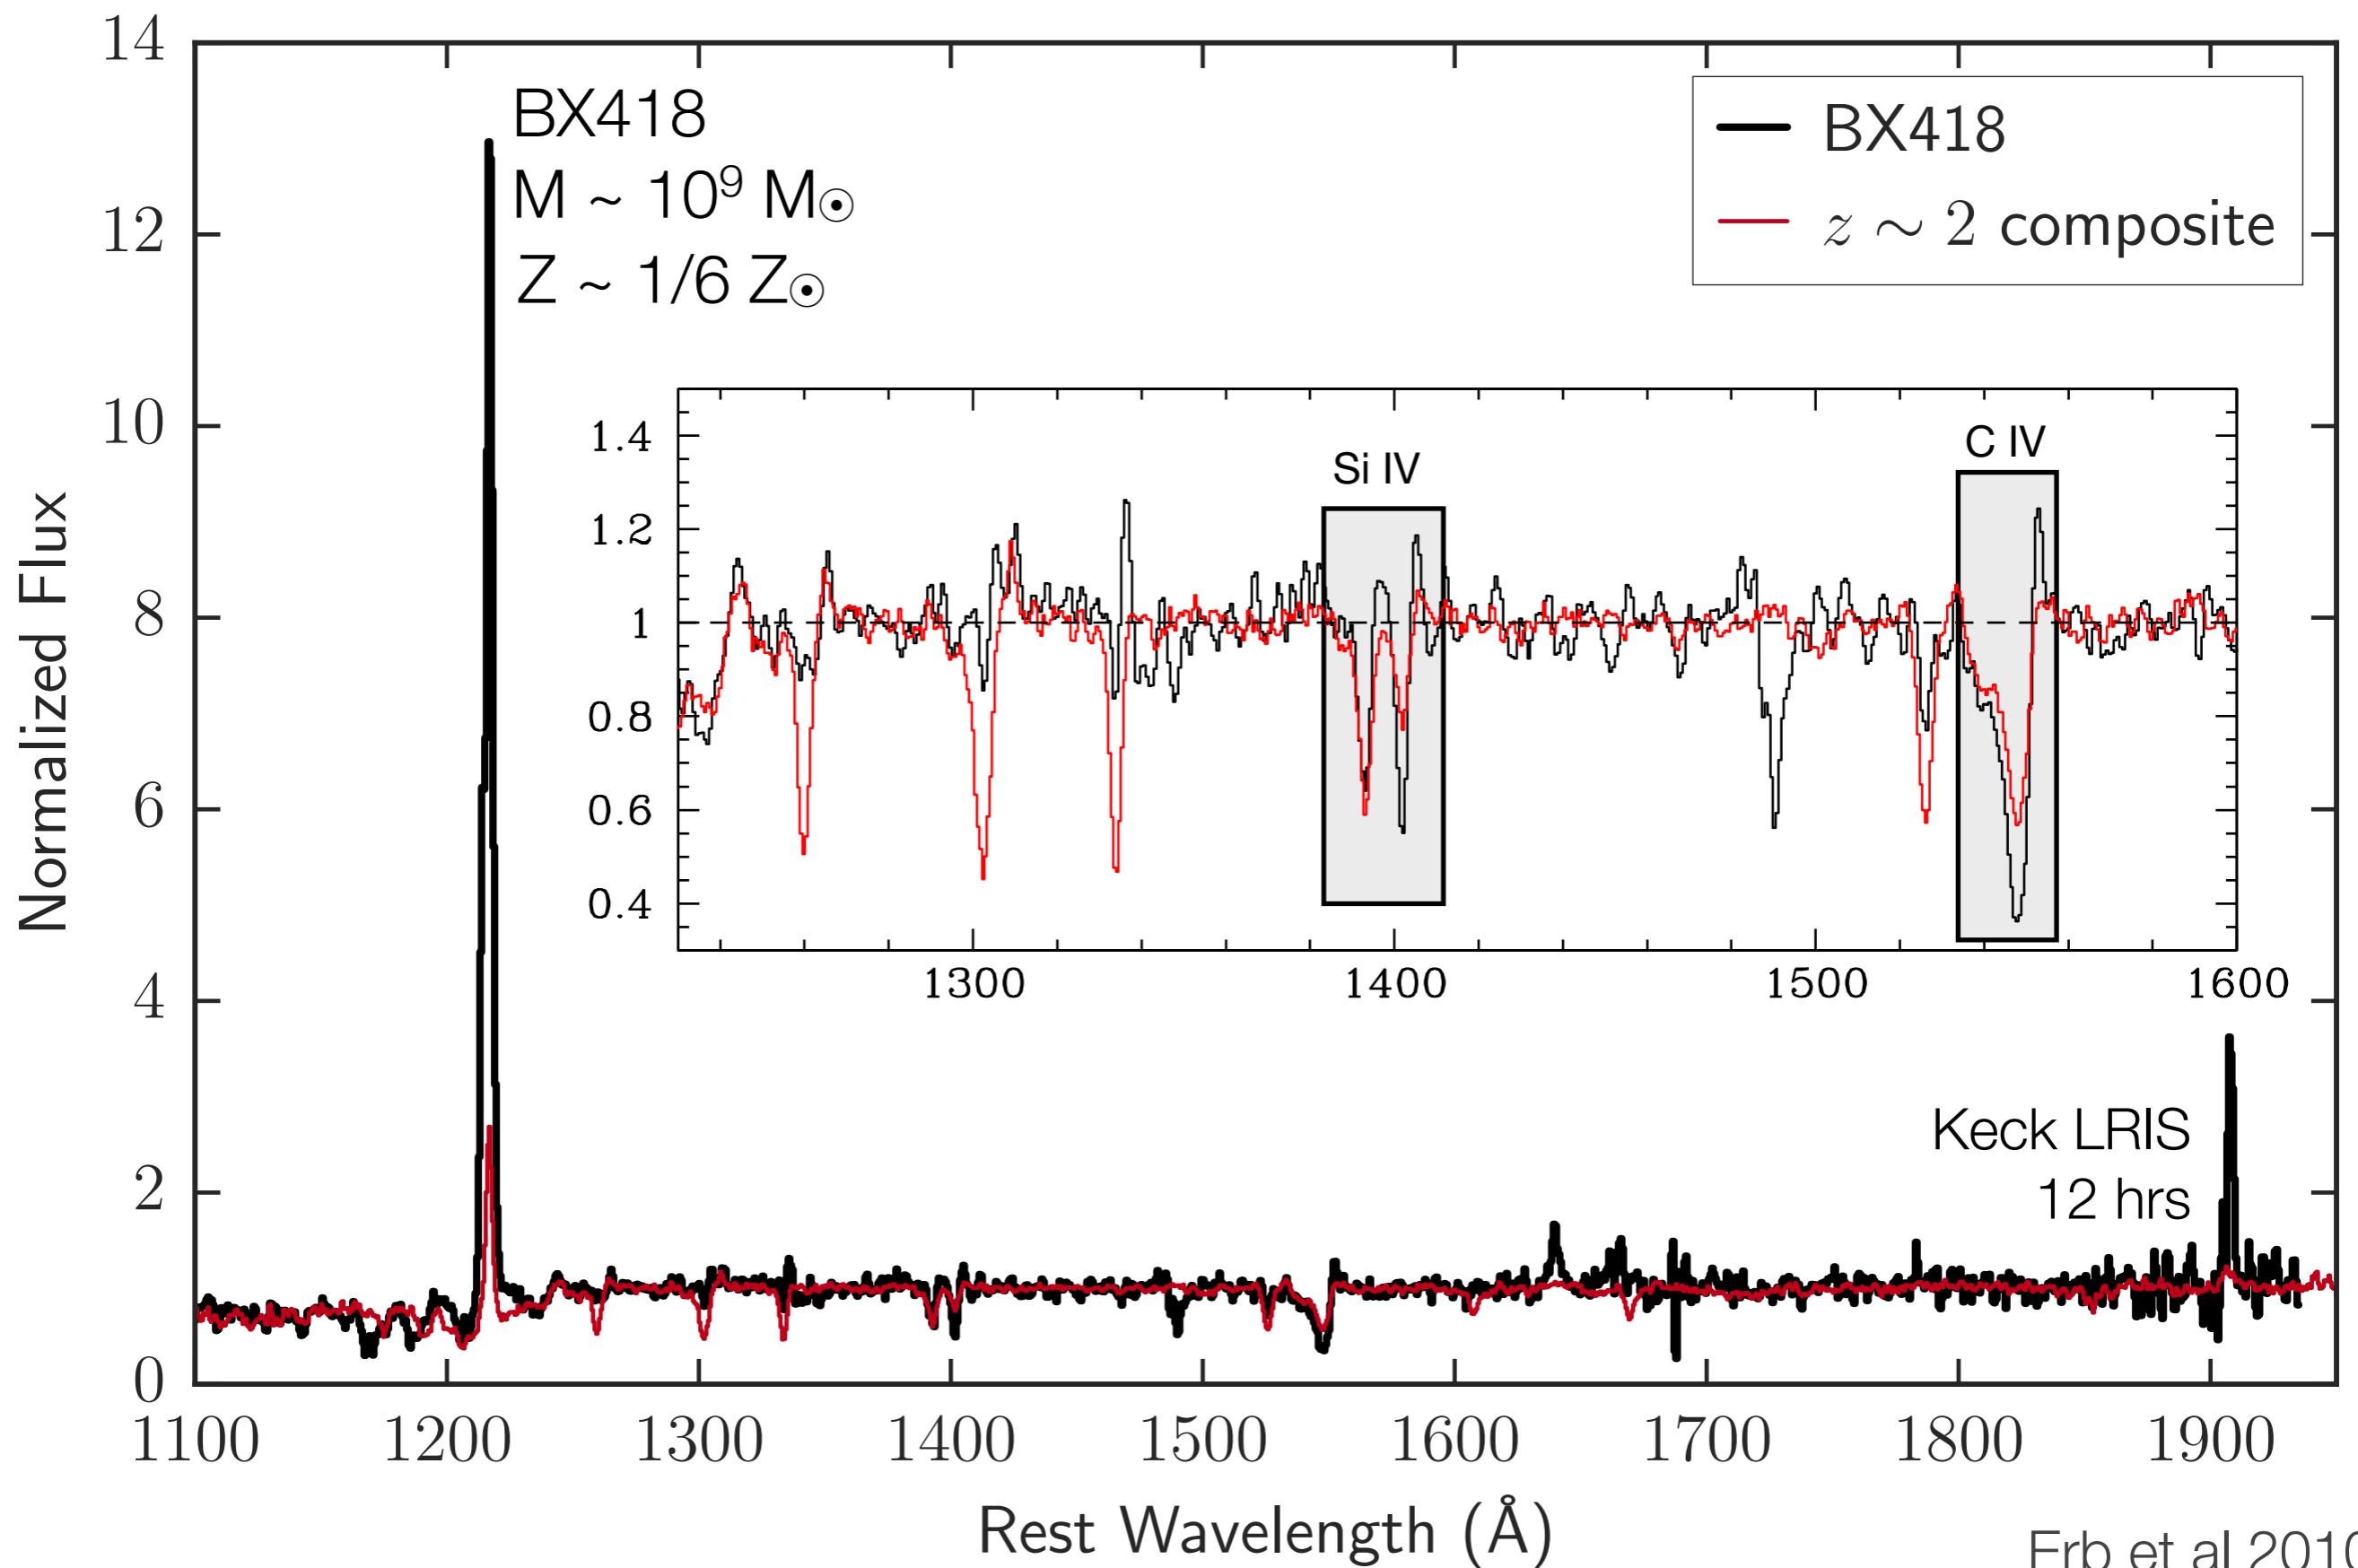

MS1512-cB58
Pettini et al 2002

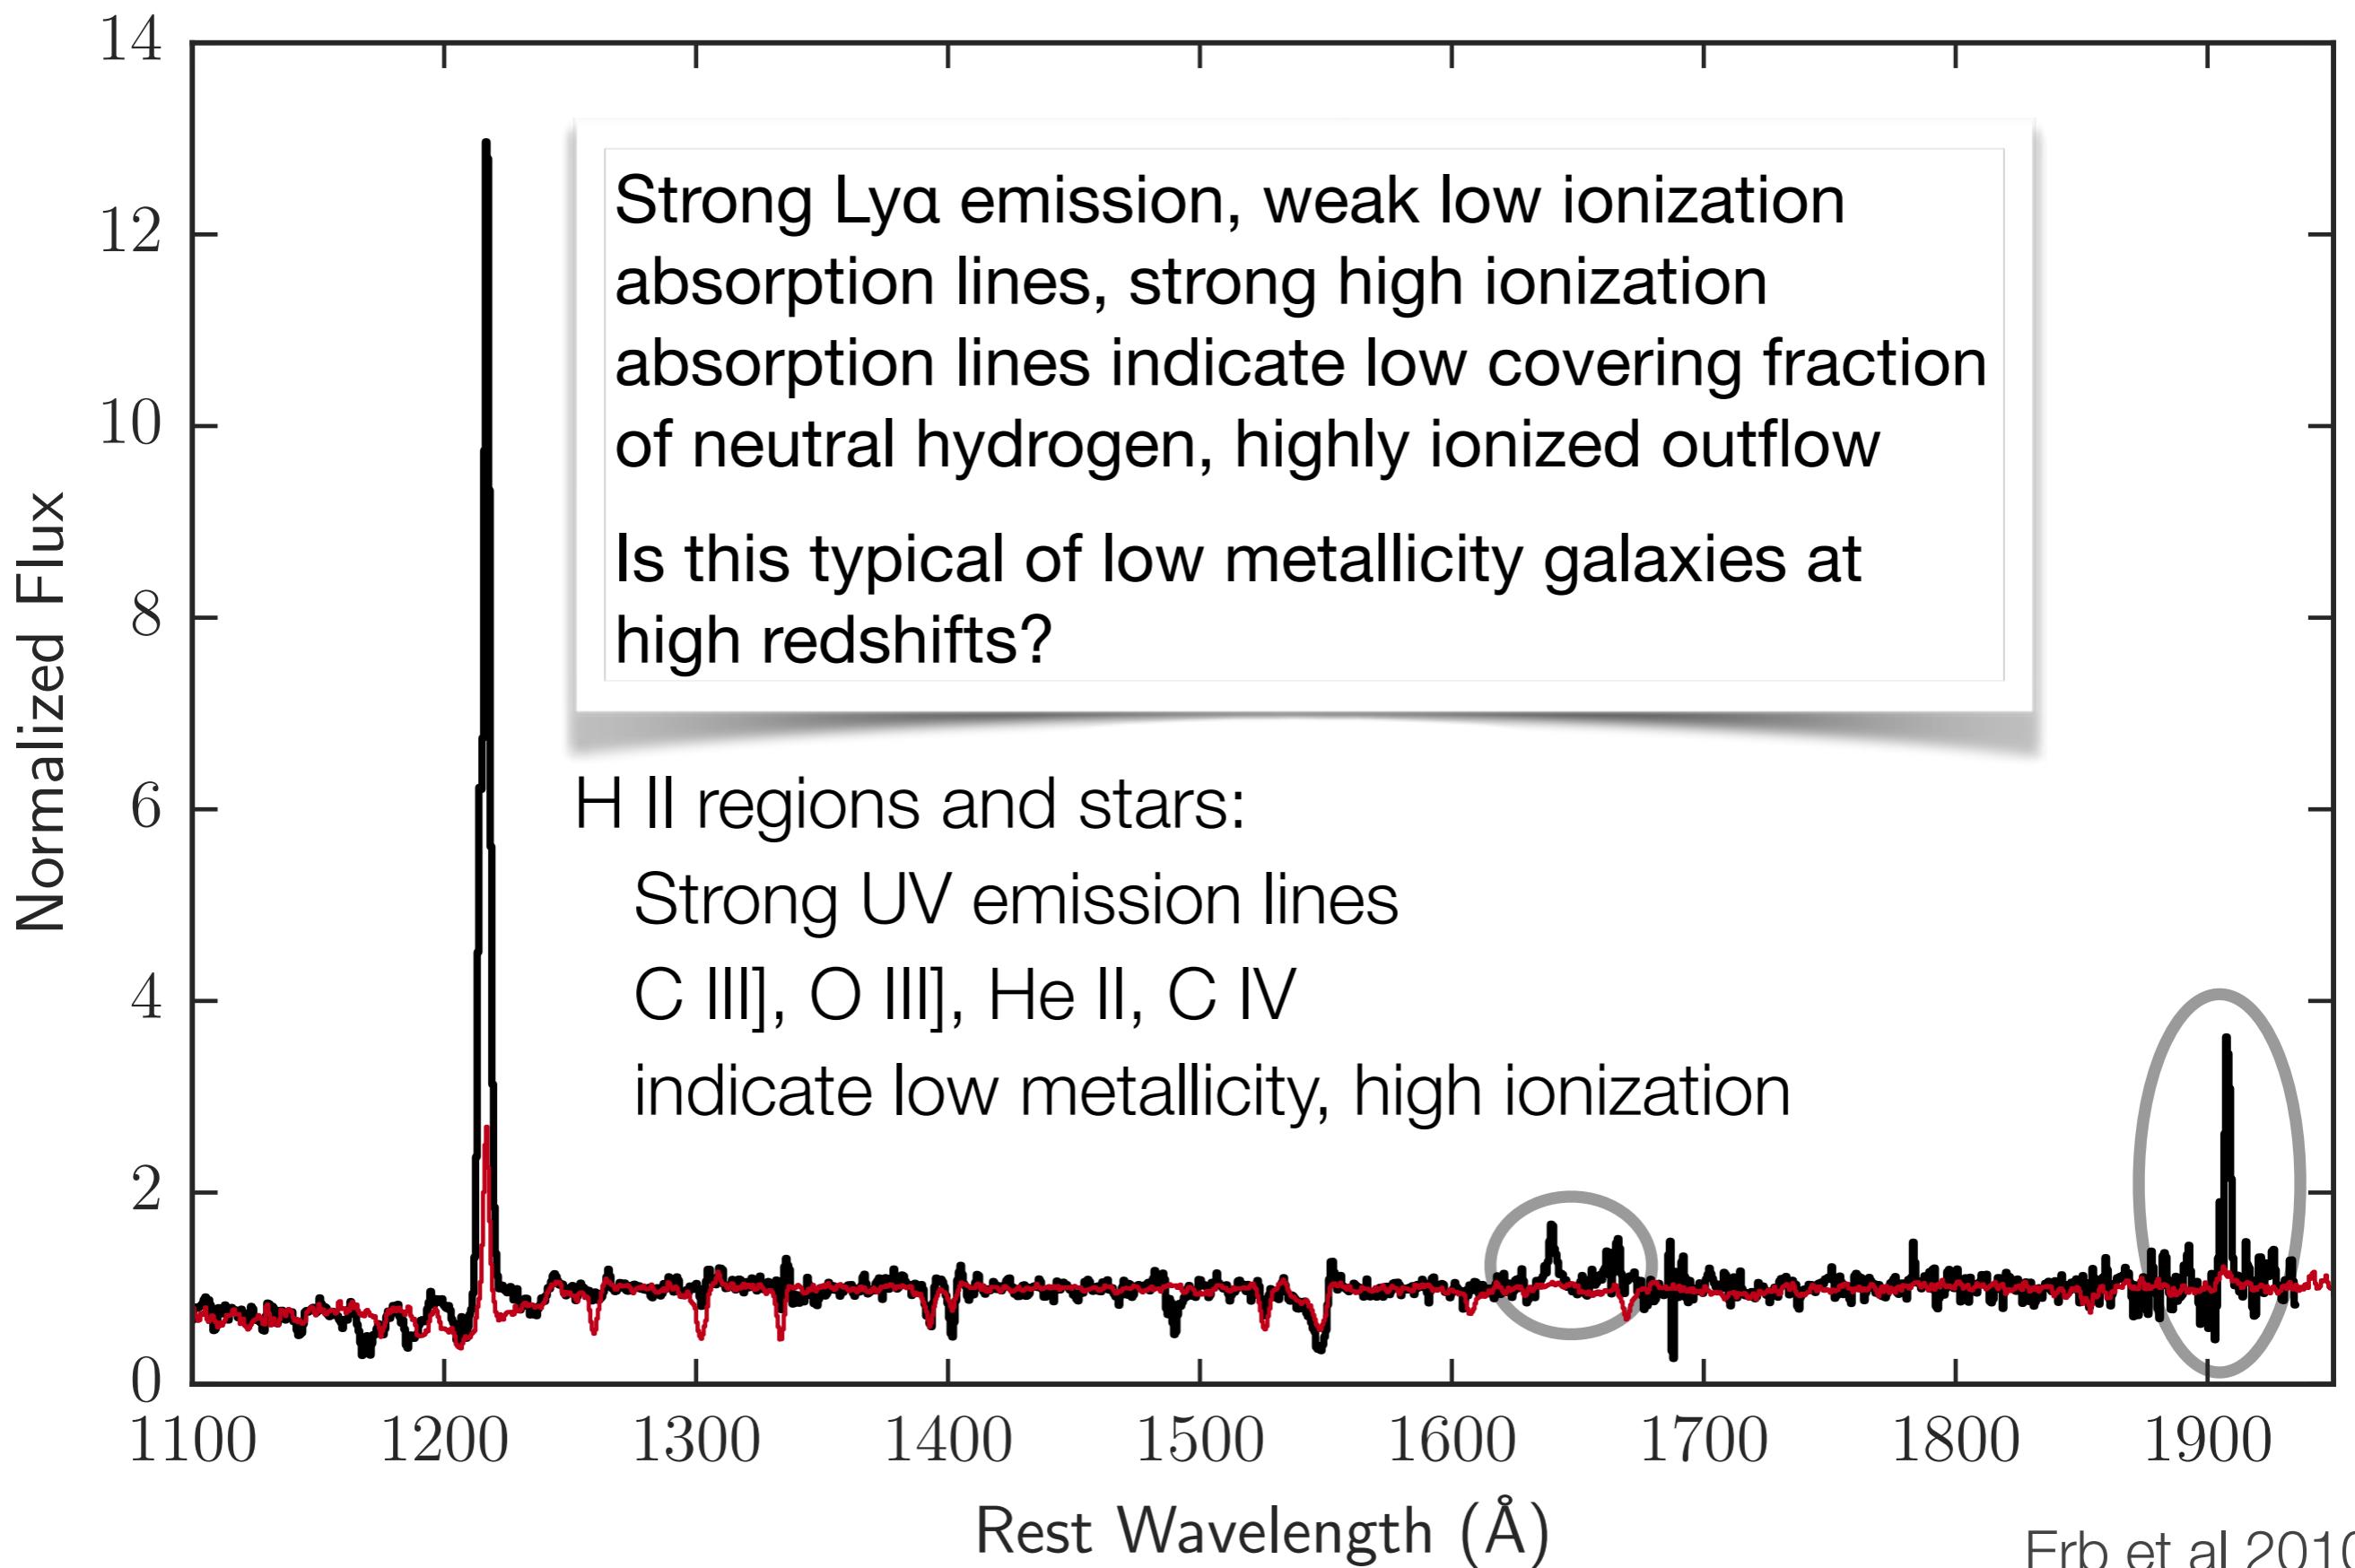

A low mass $z \sim 2$ galaxy: rest-frame UV spectrum

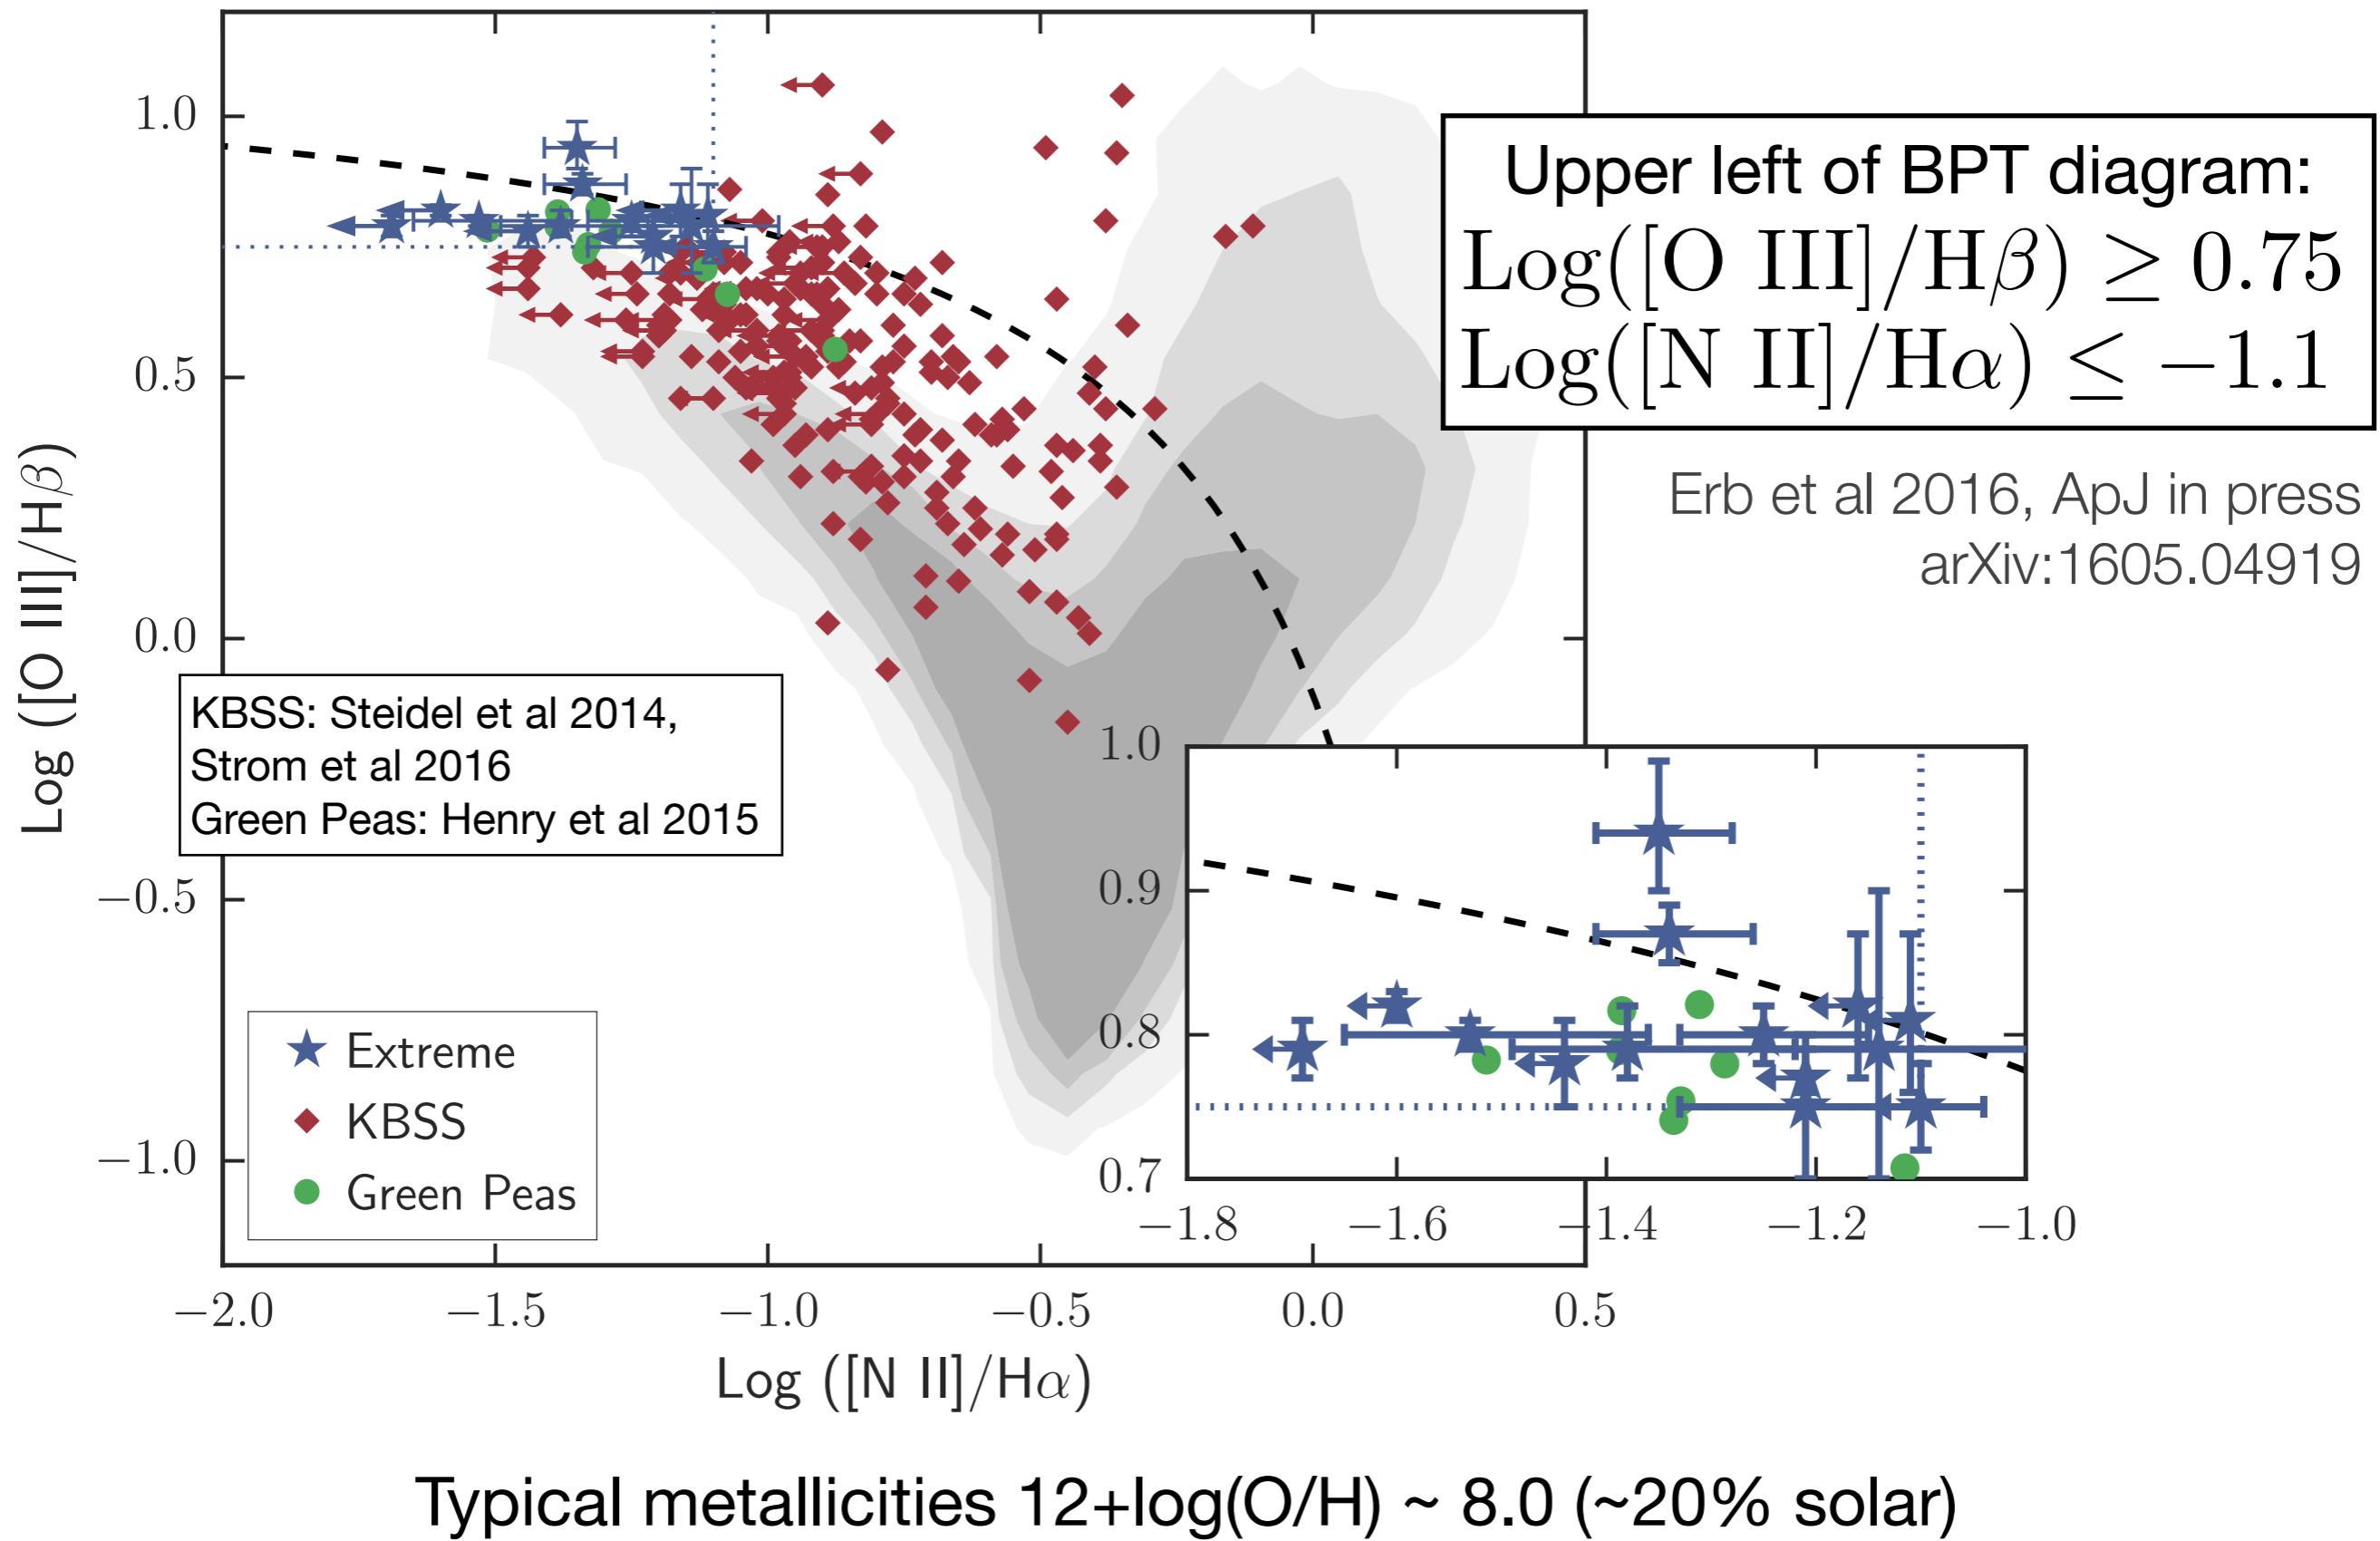

A low mass $z \sim 2$ galaxy: rest-frame UV spectrum

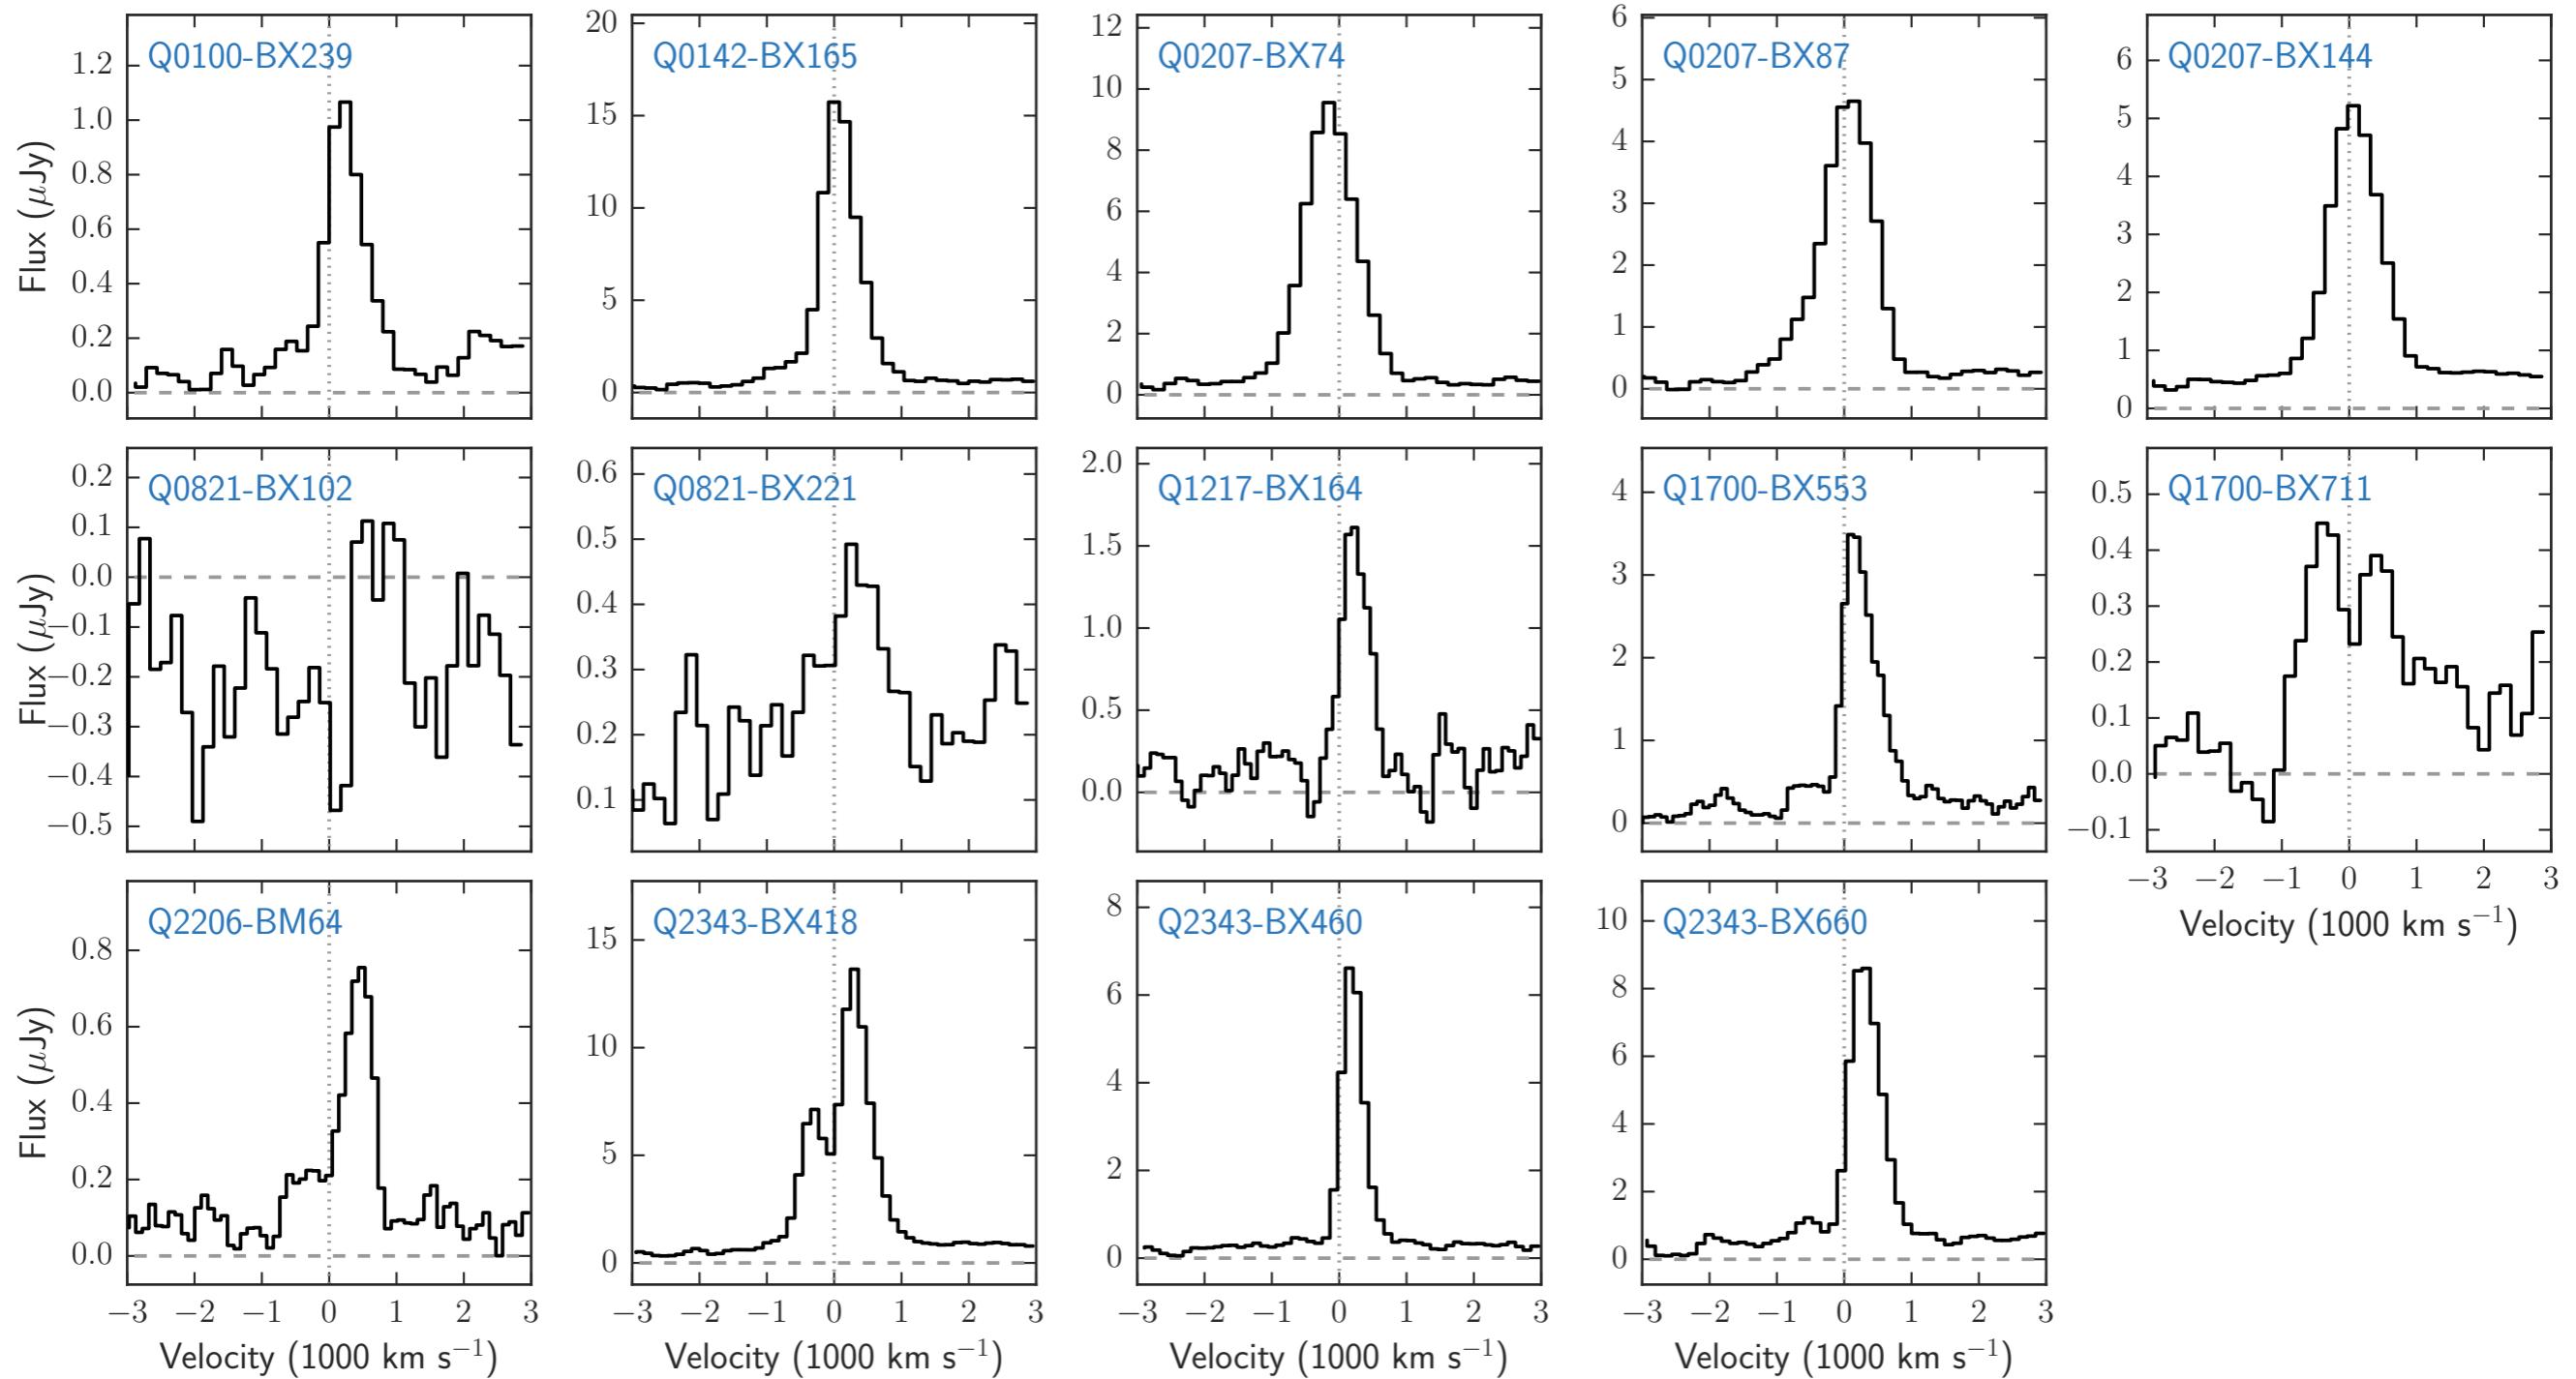

A low mass z~2 galaxy: rest-frame UV spectrum

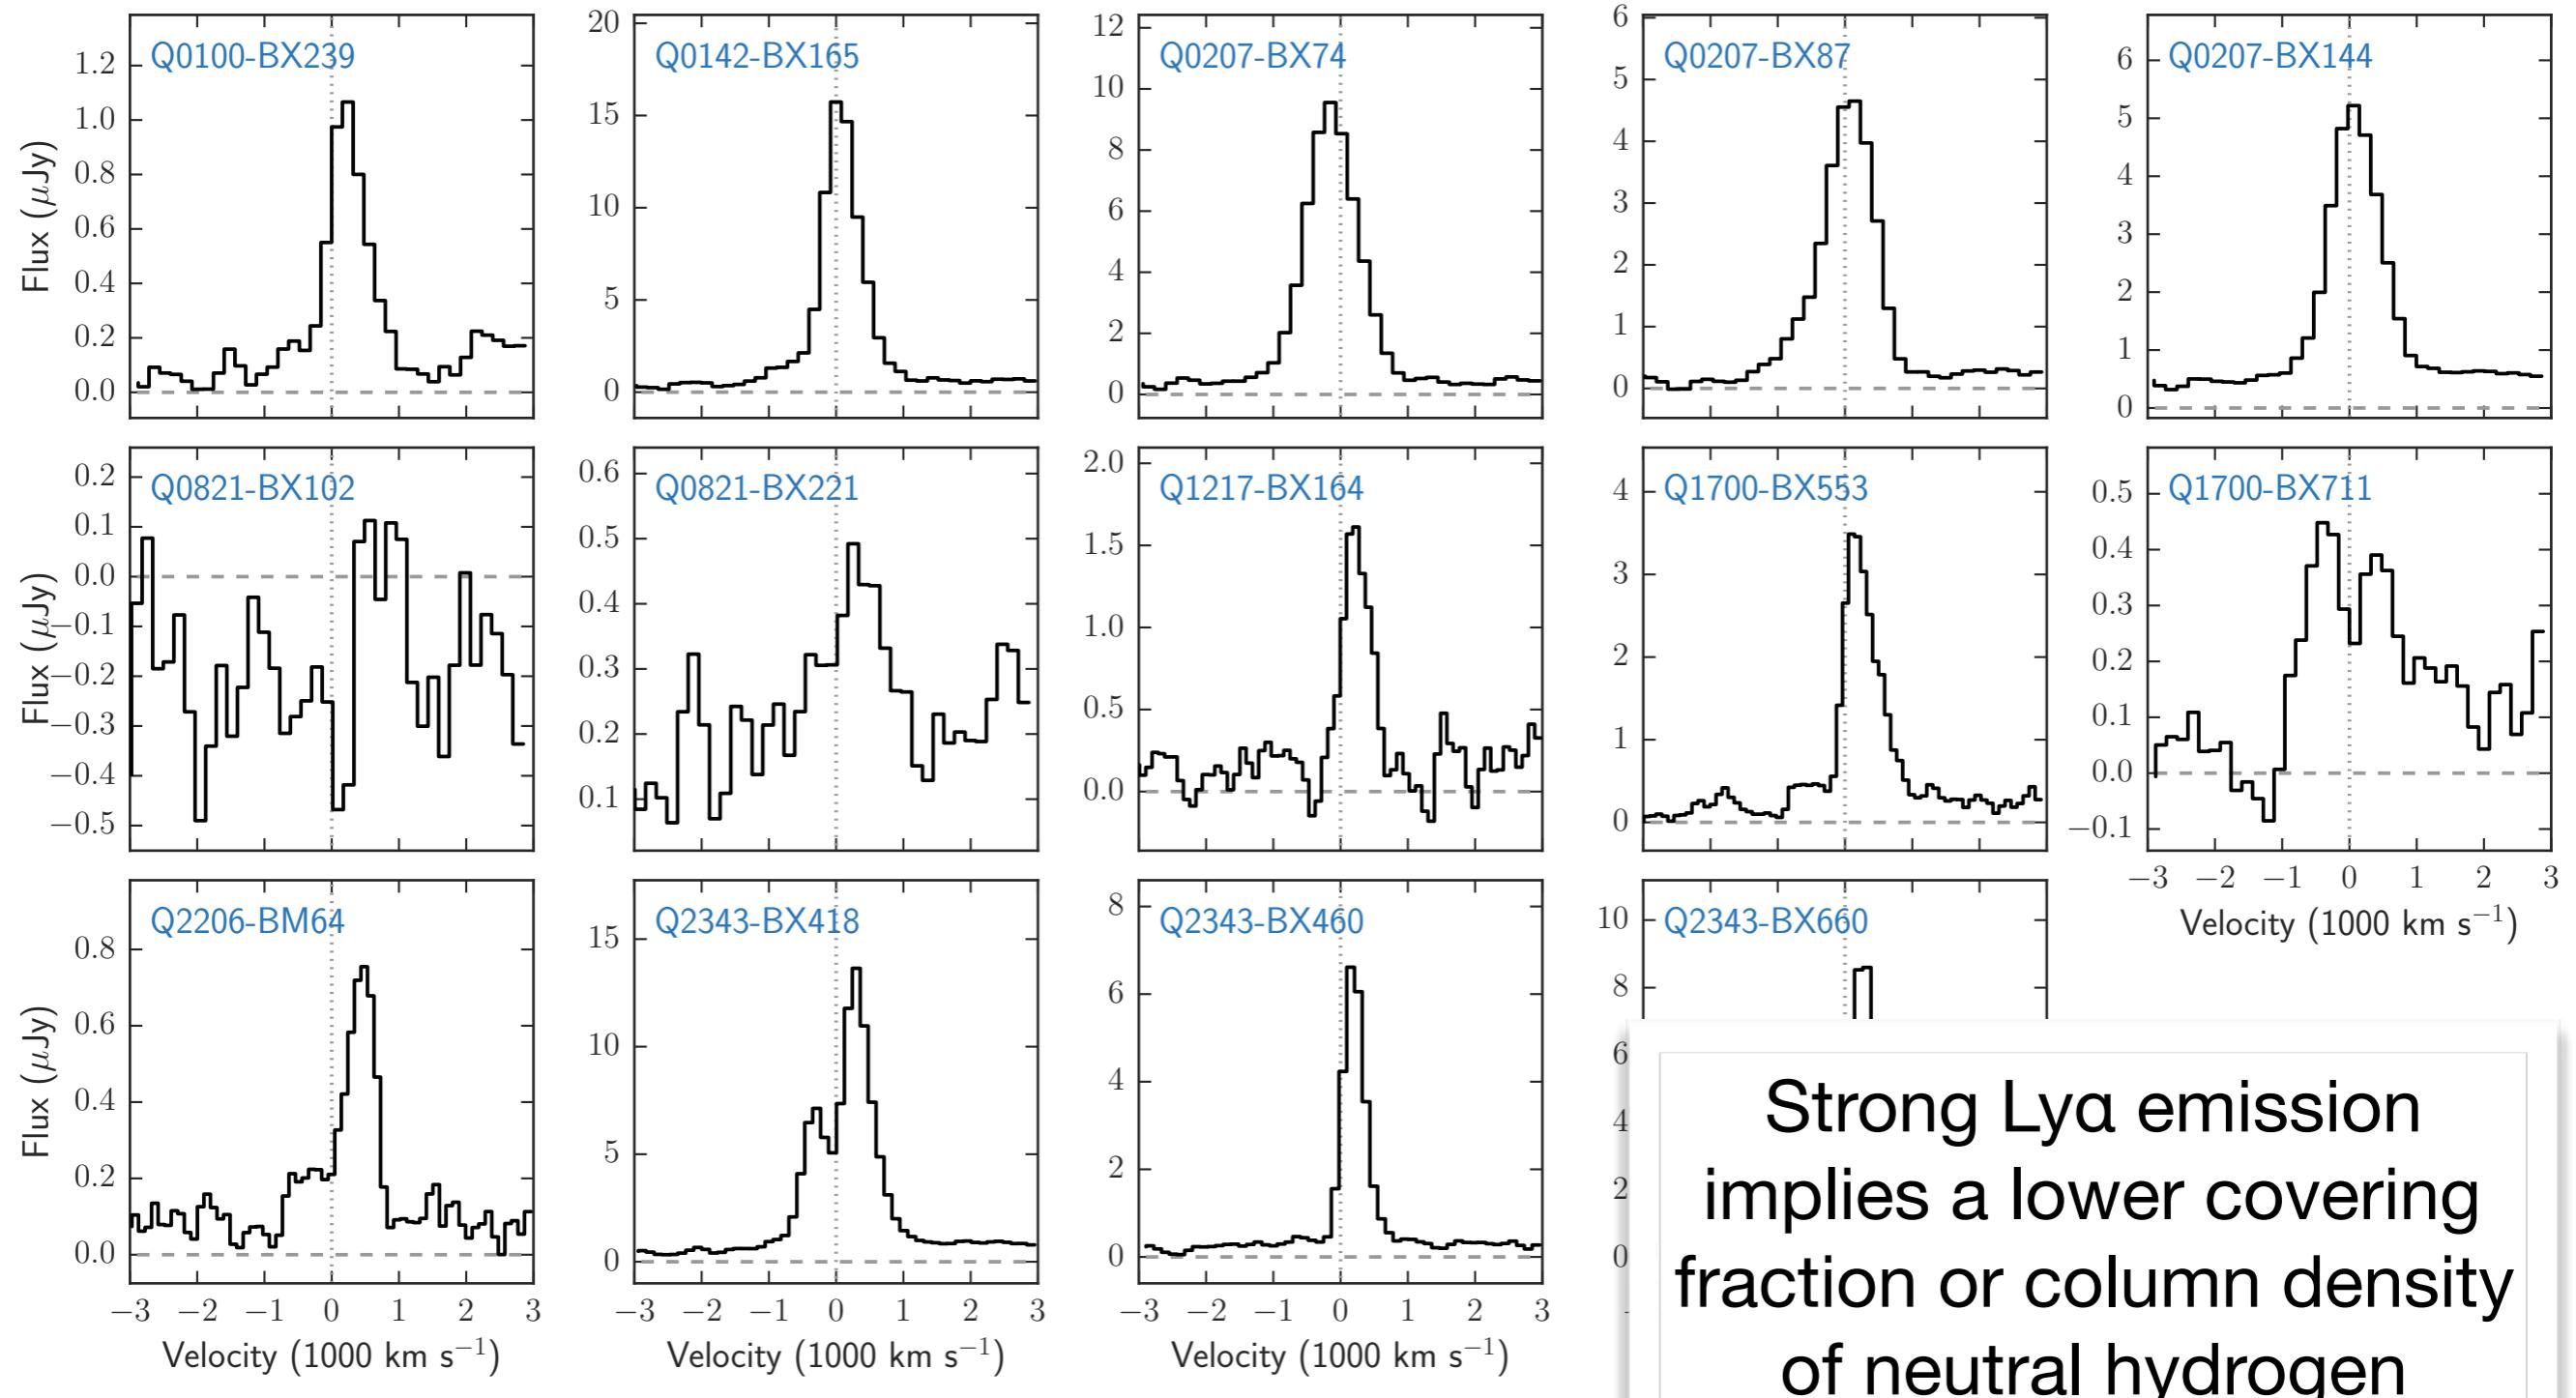

Selecting low metallicity, highly ionized galaxies

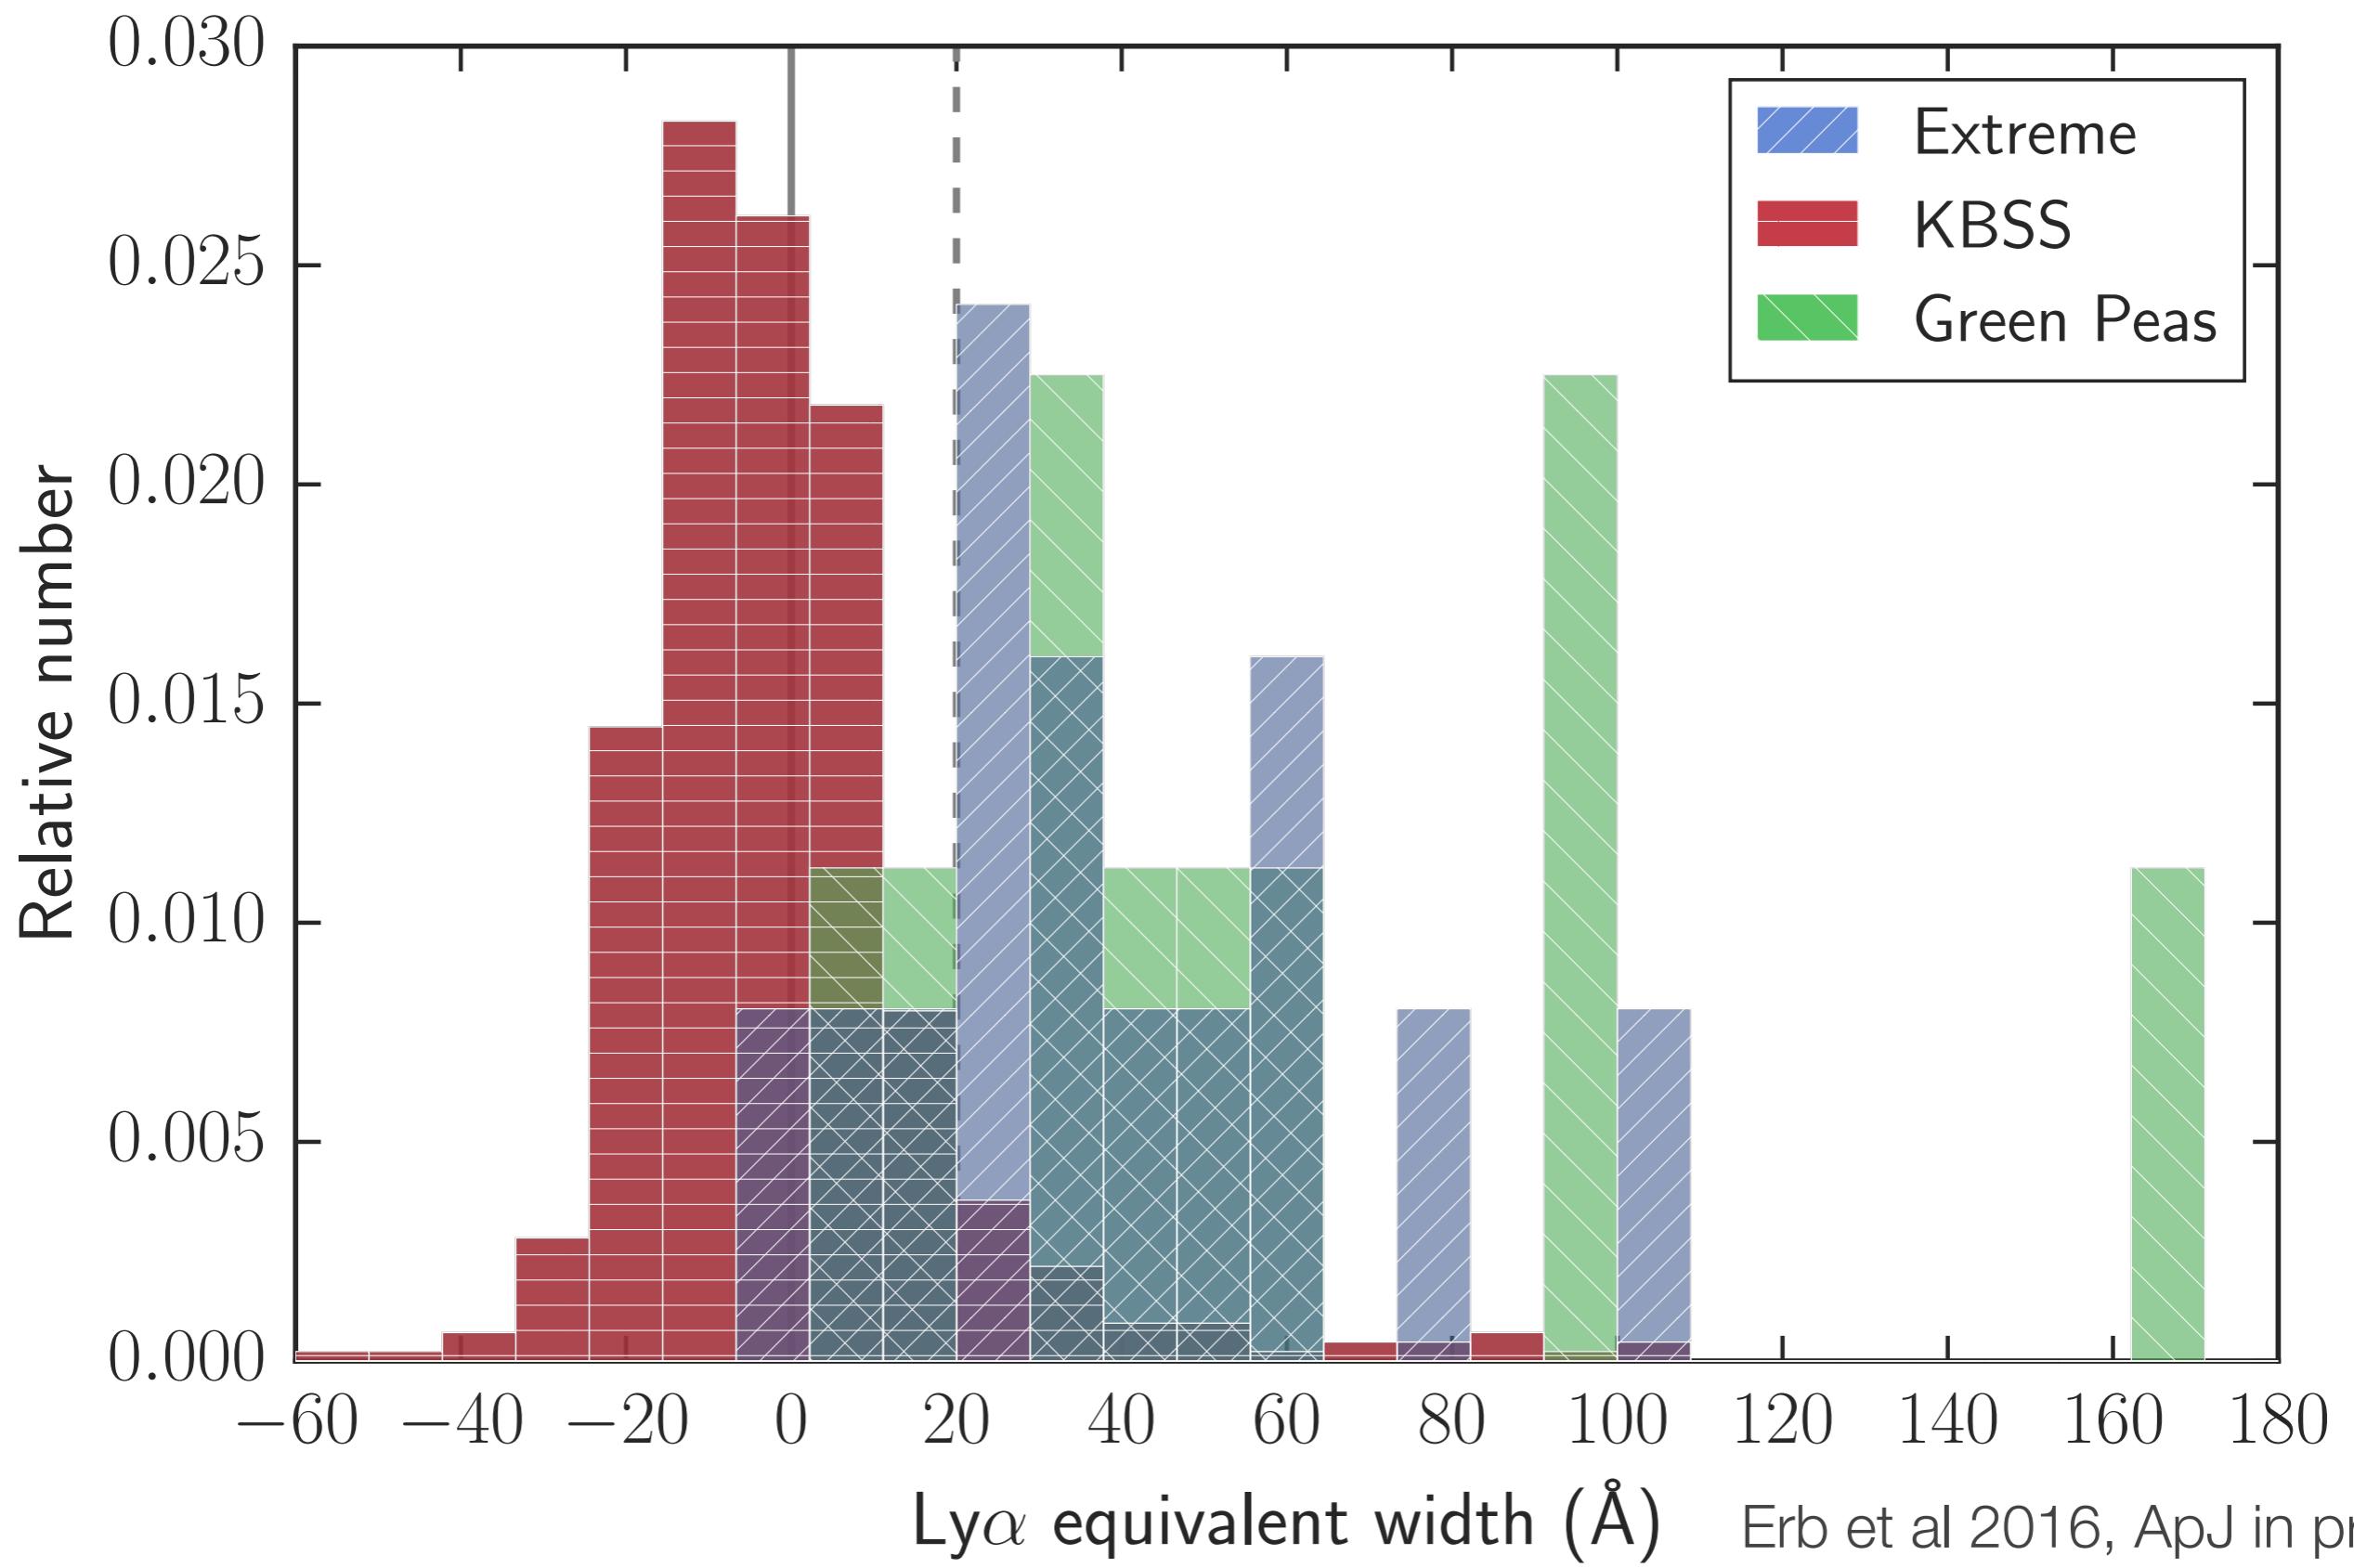

Most extreme BPT galaxies have strong Ly α emission

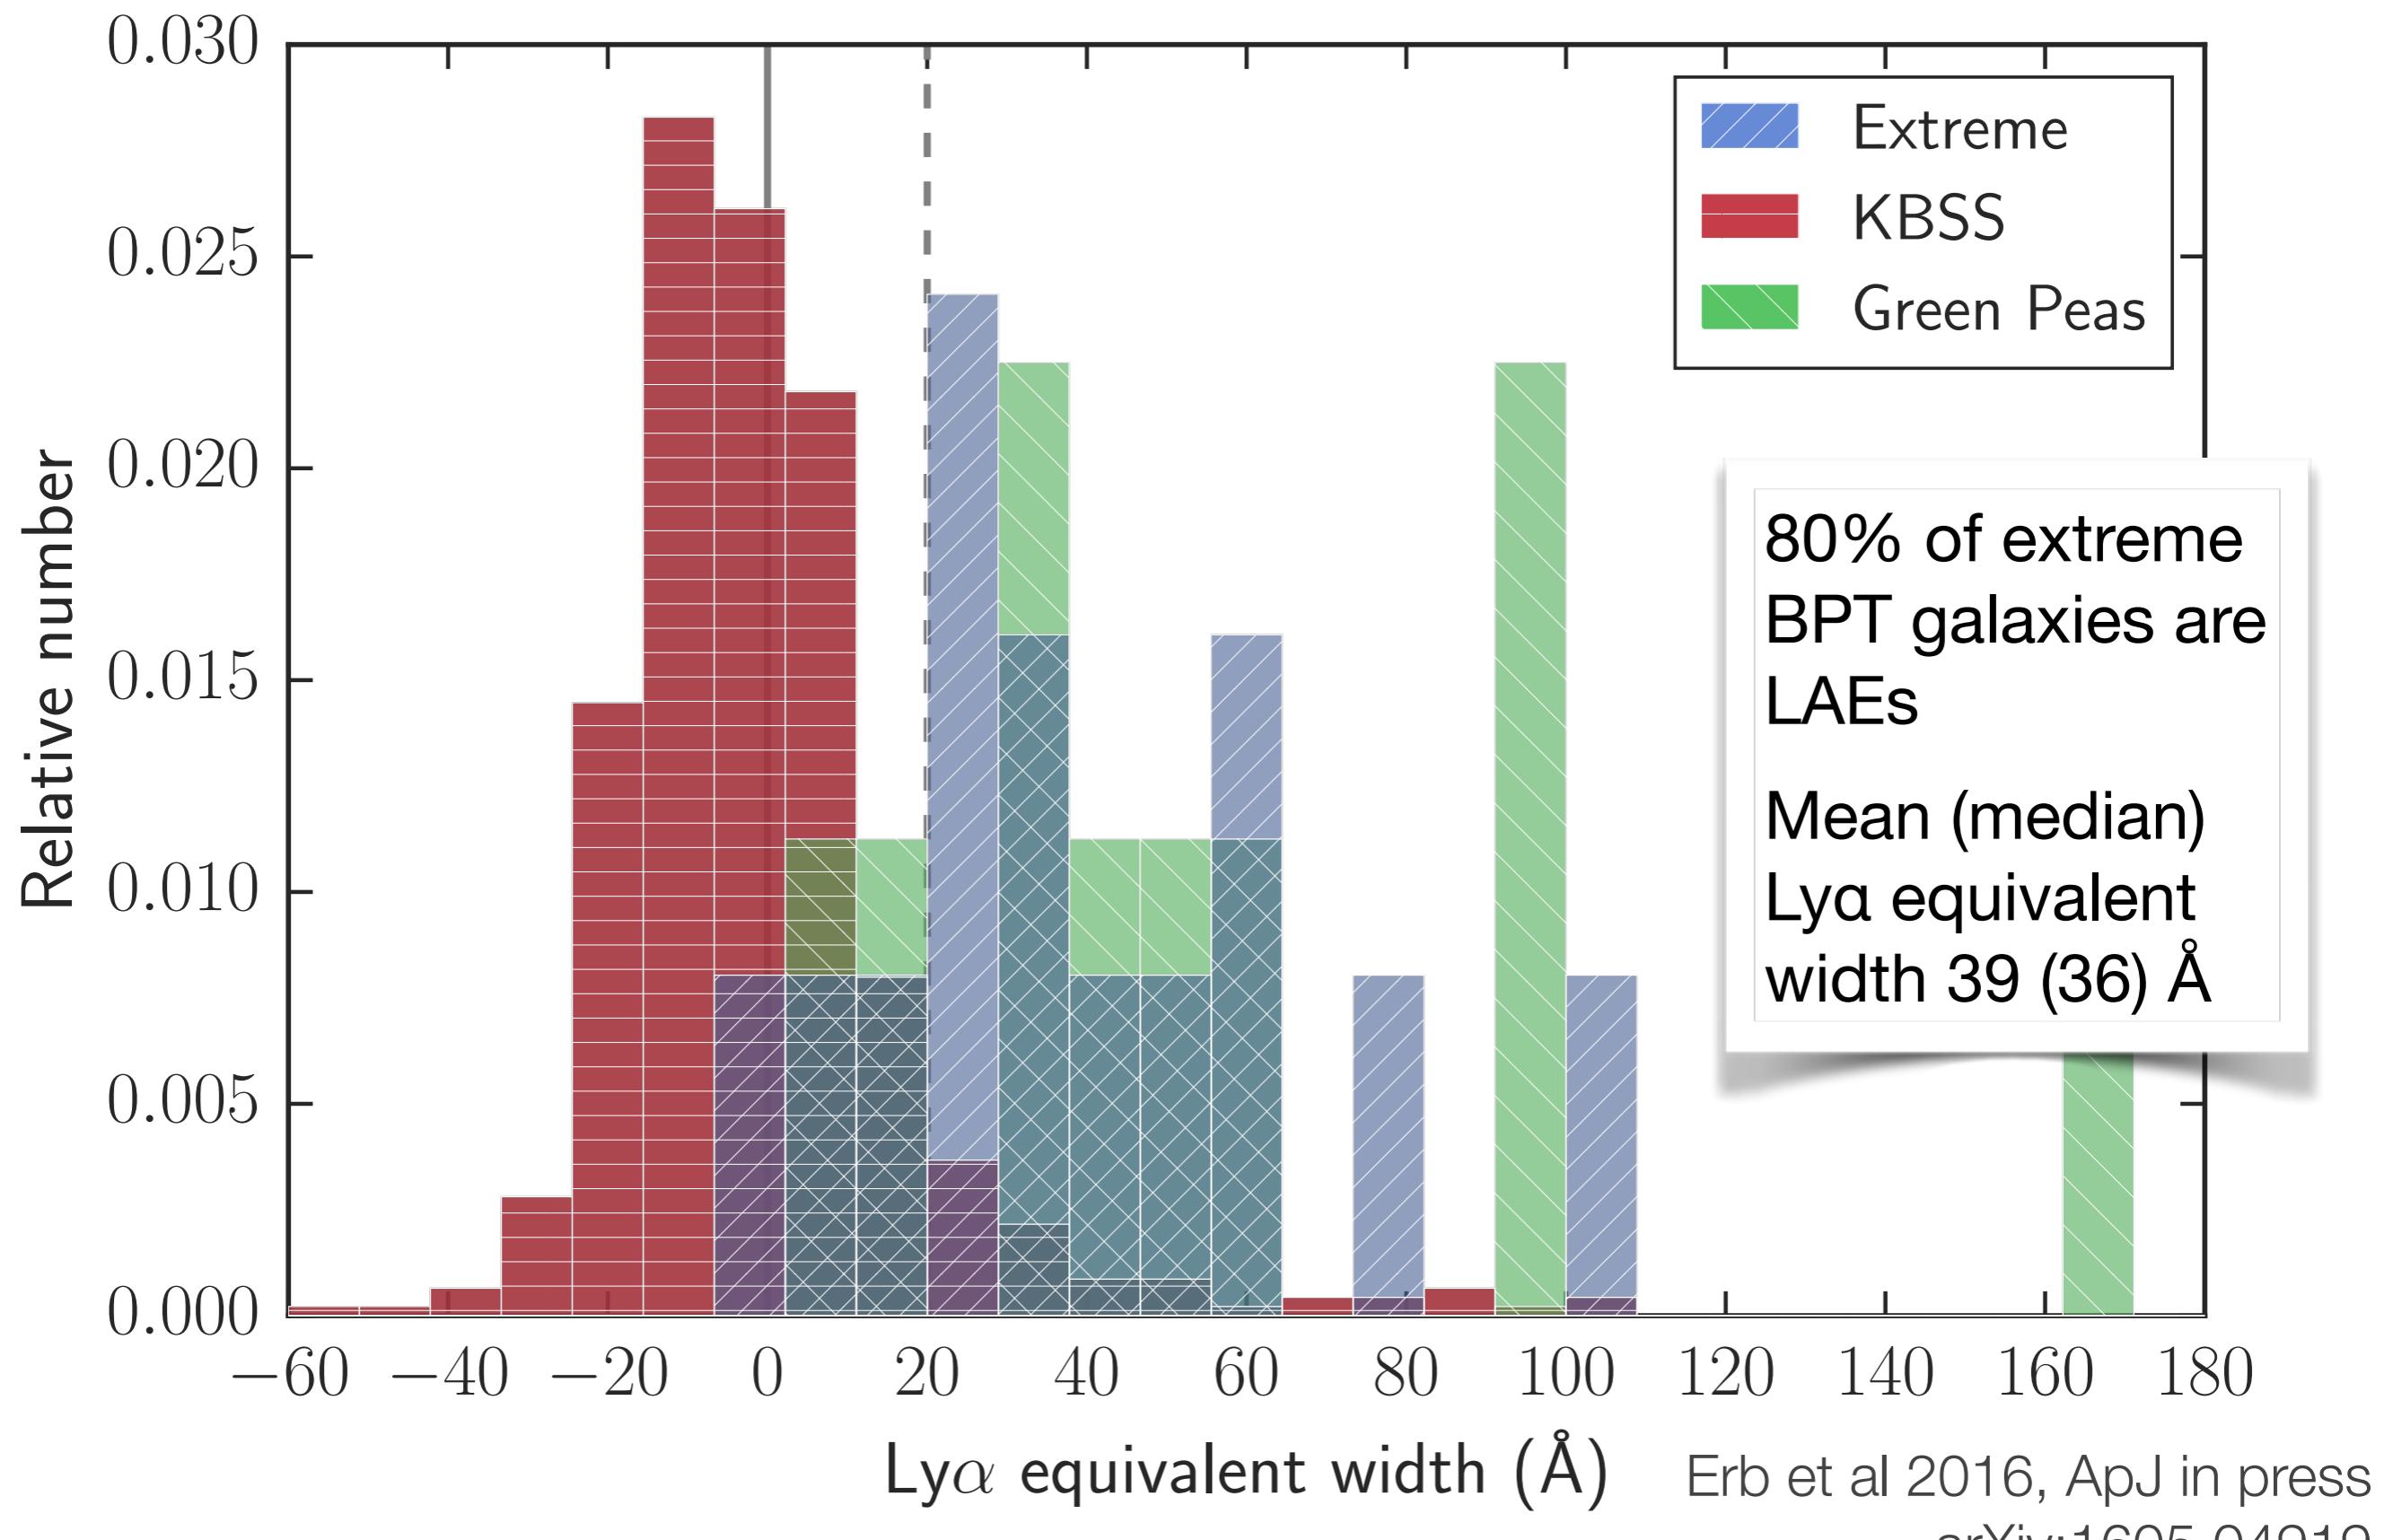

Most extreme BPT galaxies have strong Ly α emission

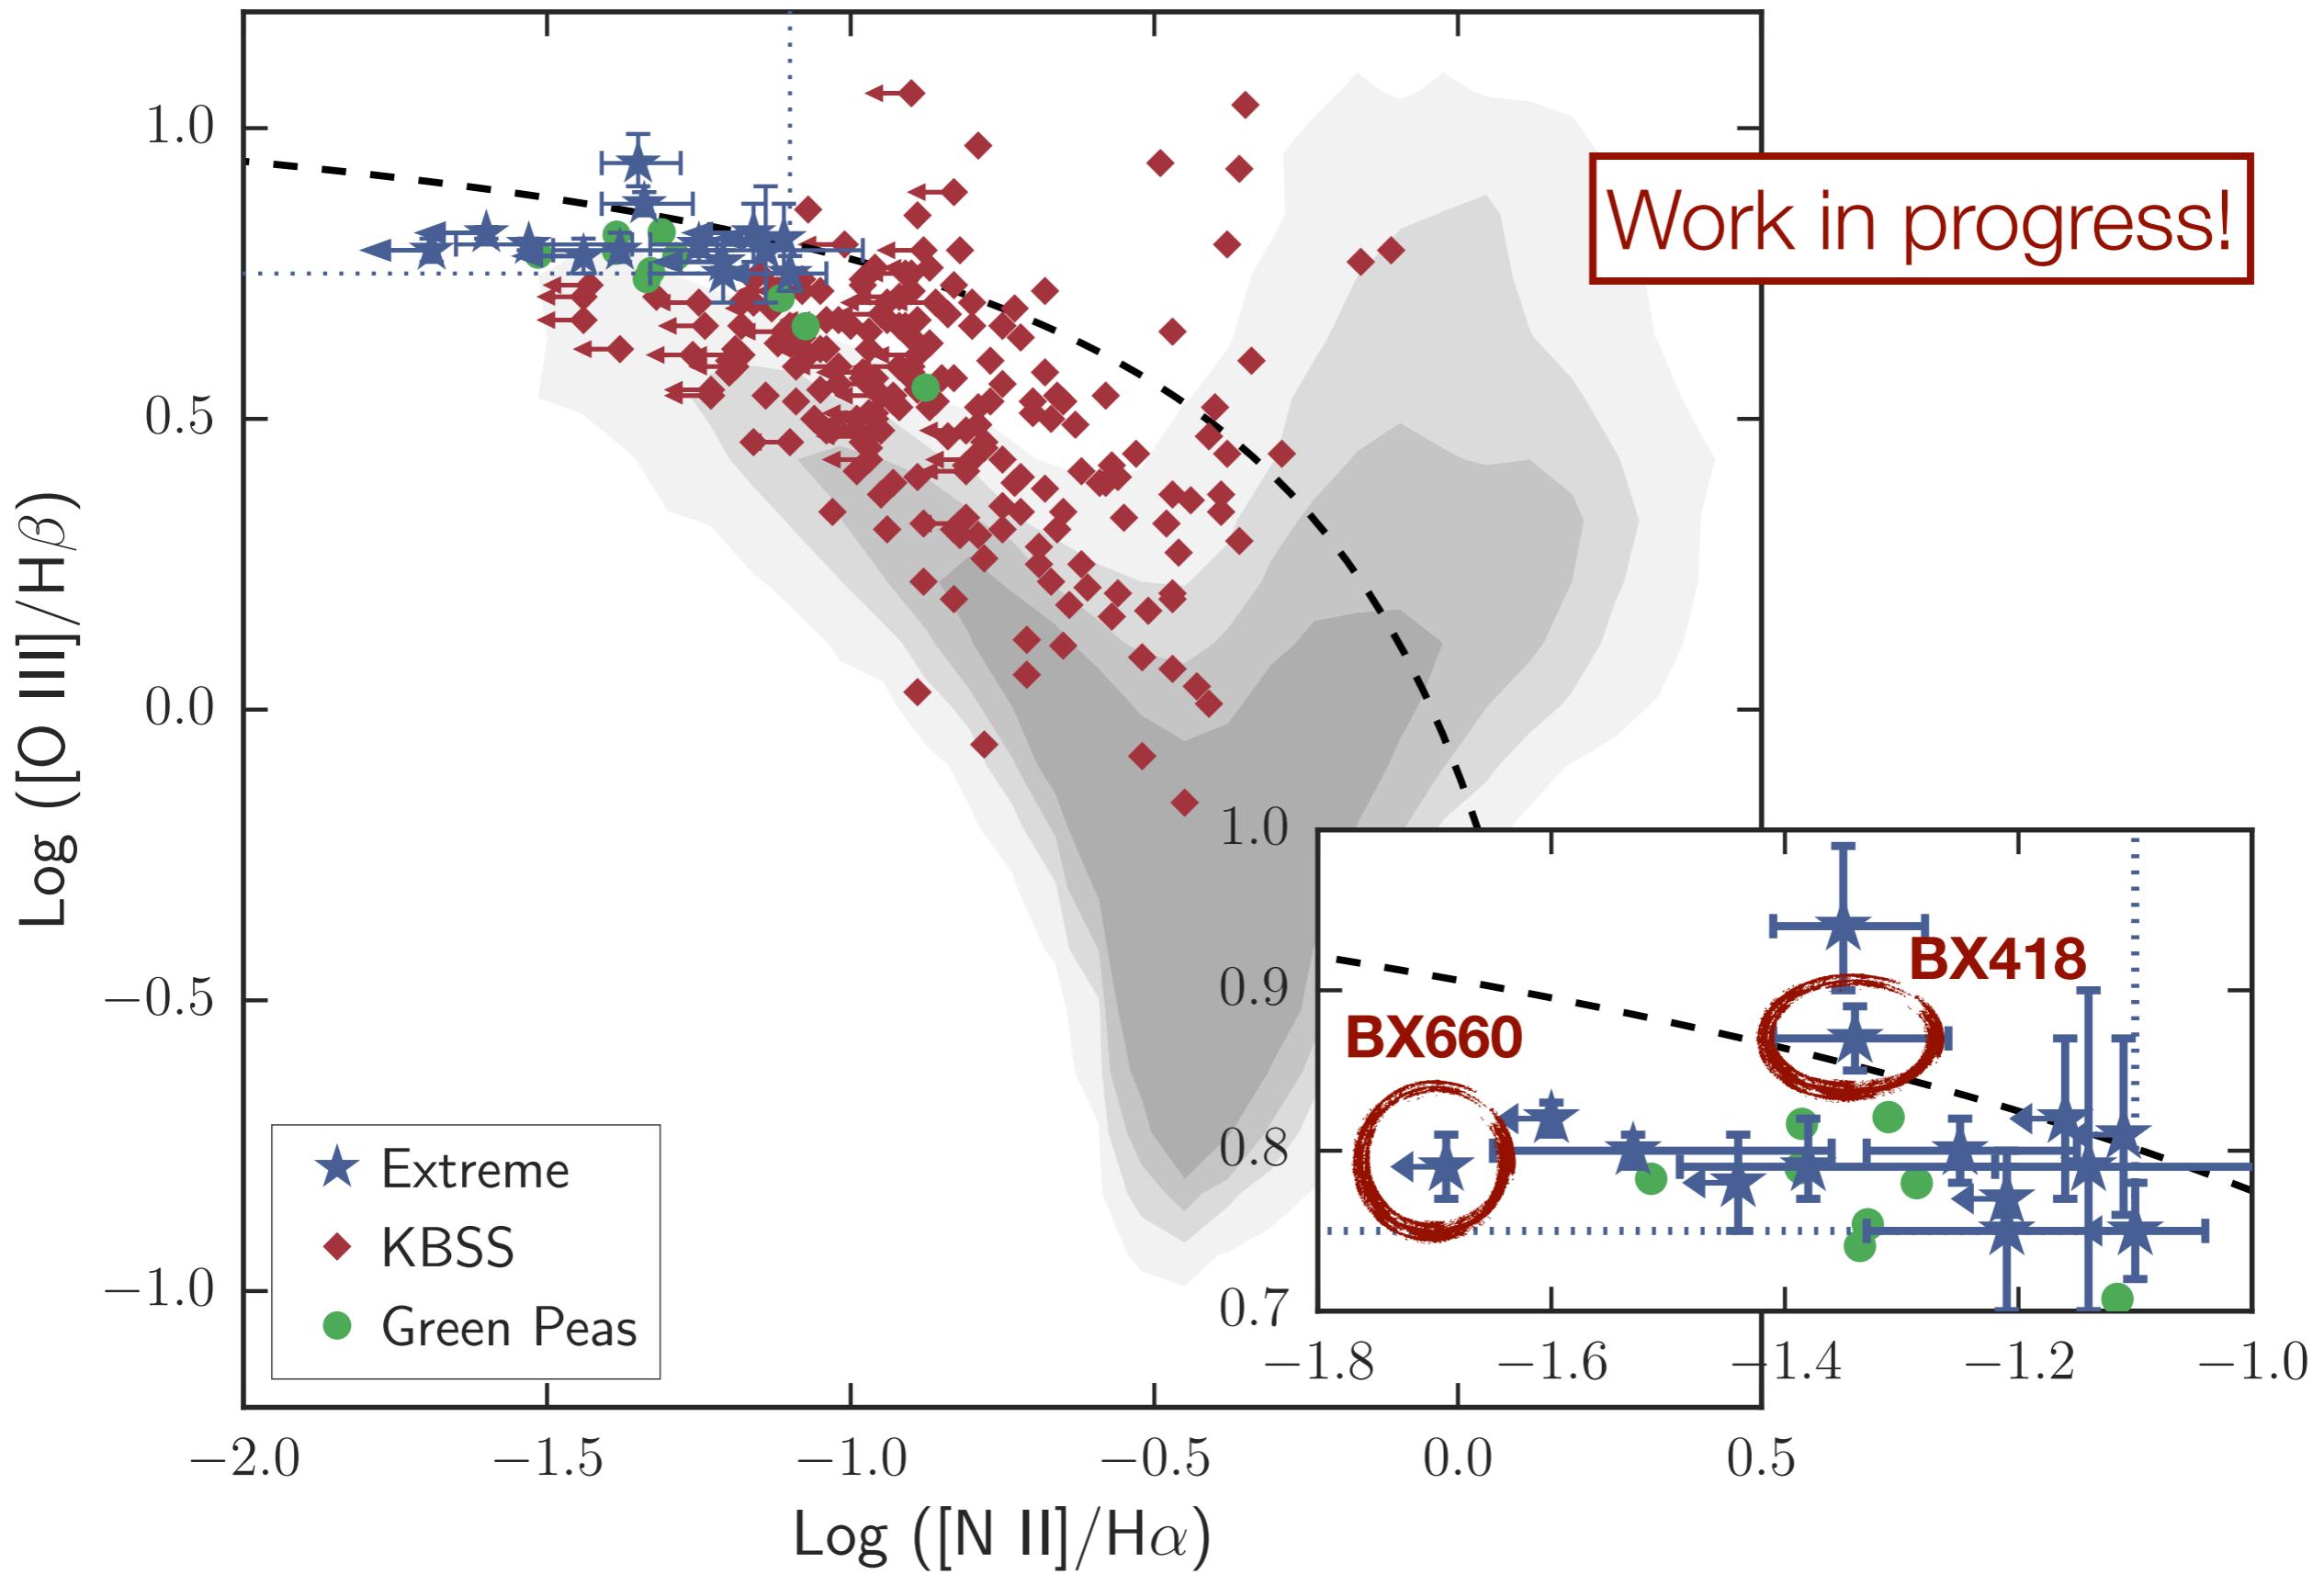

Ly α equivalent width distributions

Ly α equivalent width distributions

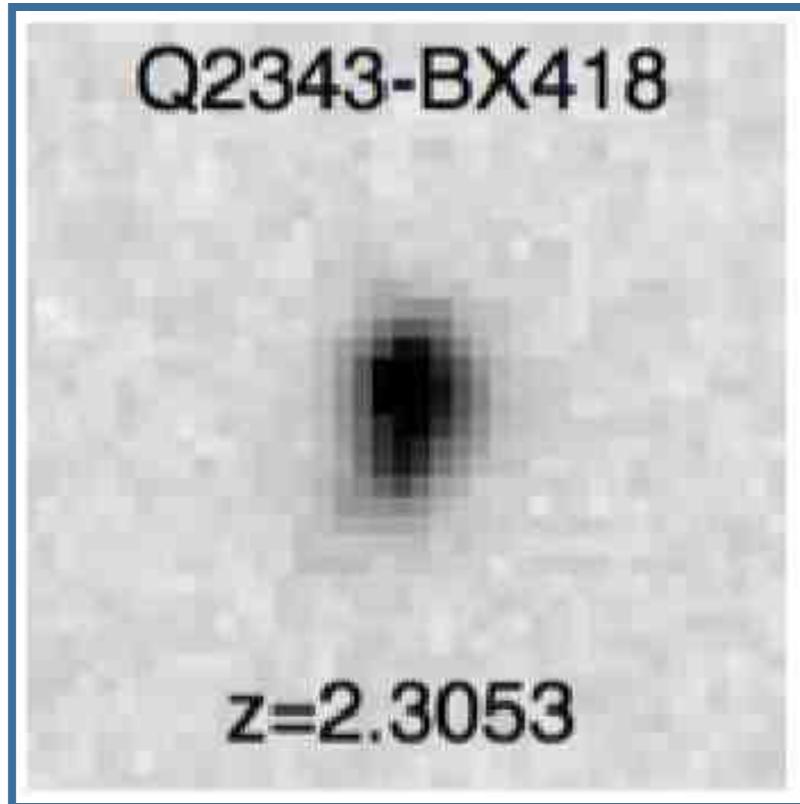

Individual galaxies: a closer look

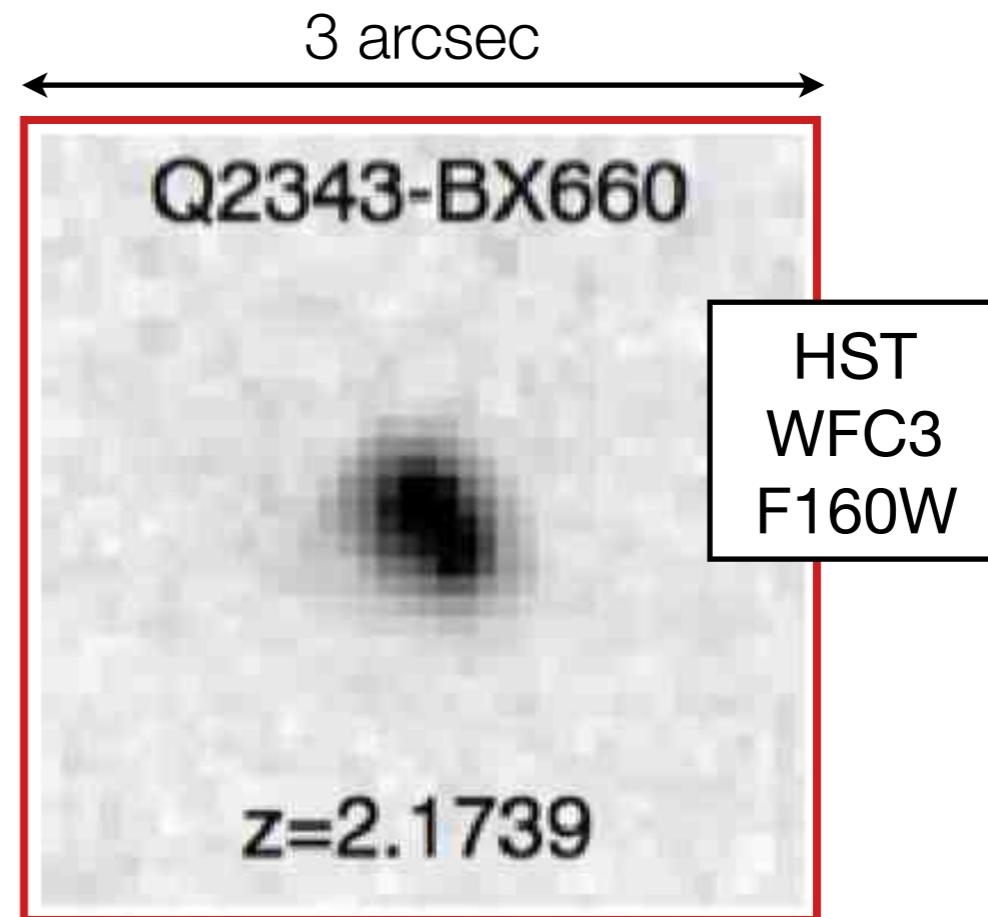

Individual galaxies: a closer look

Law et al 2012

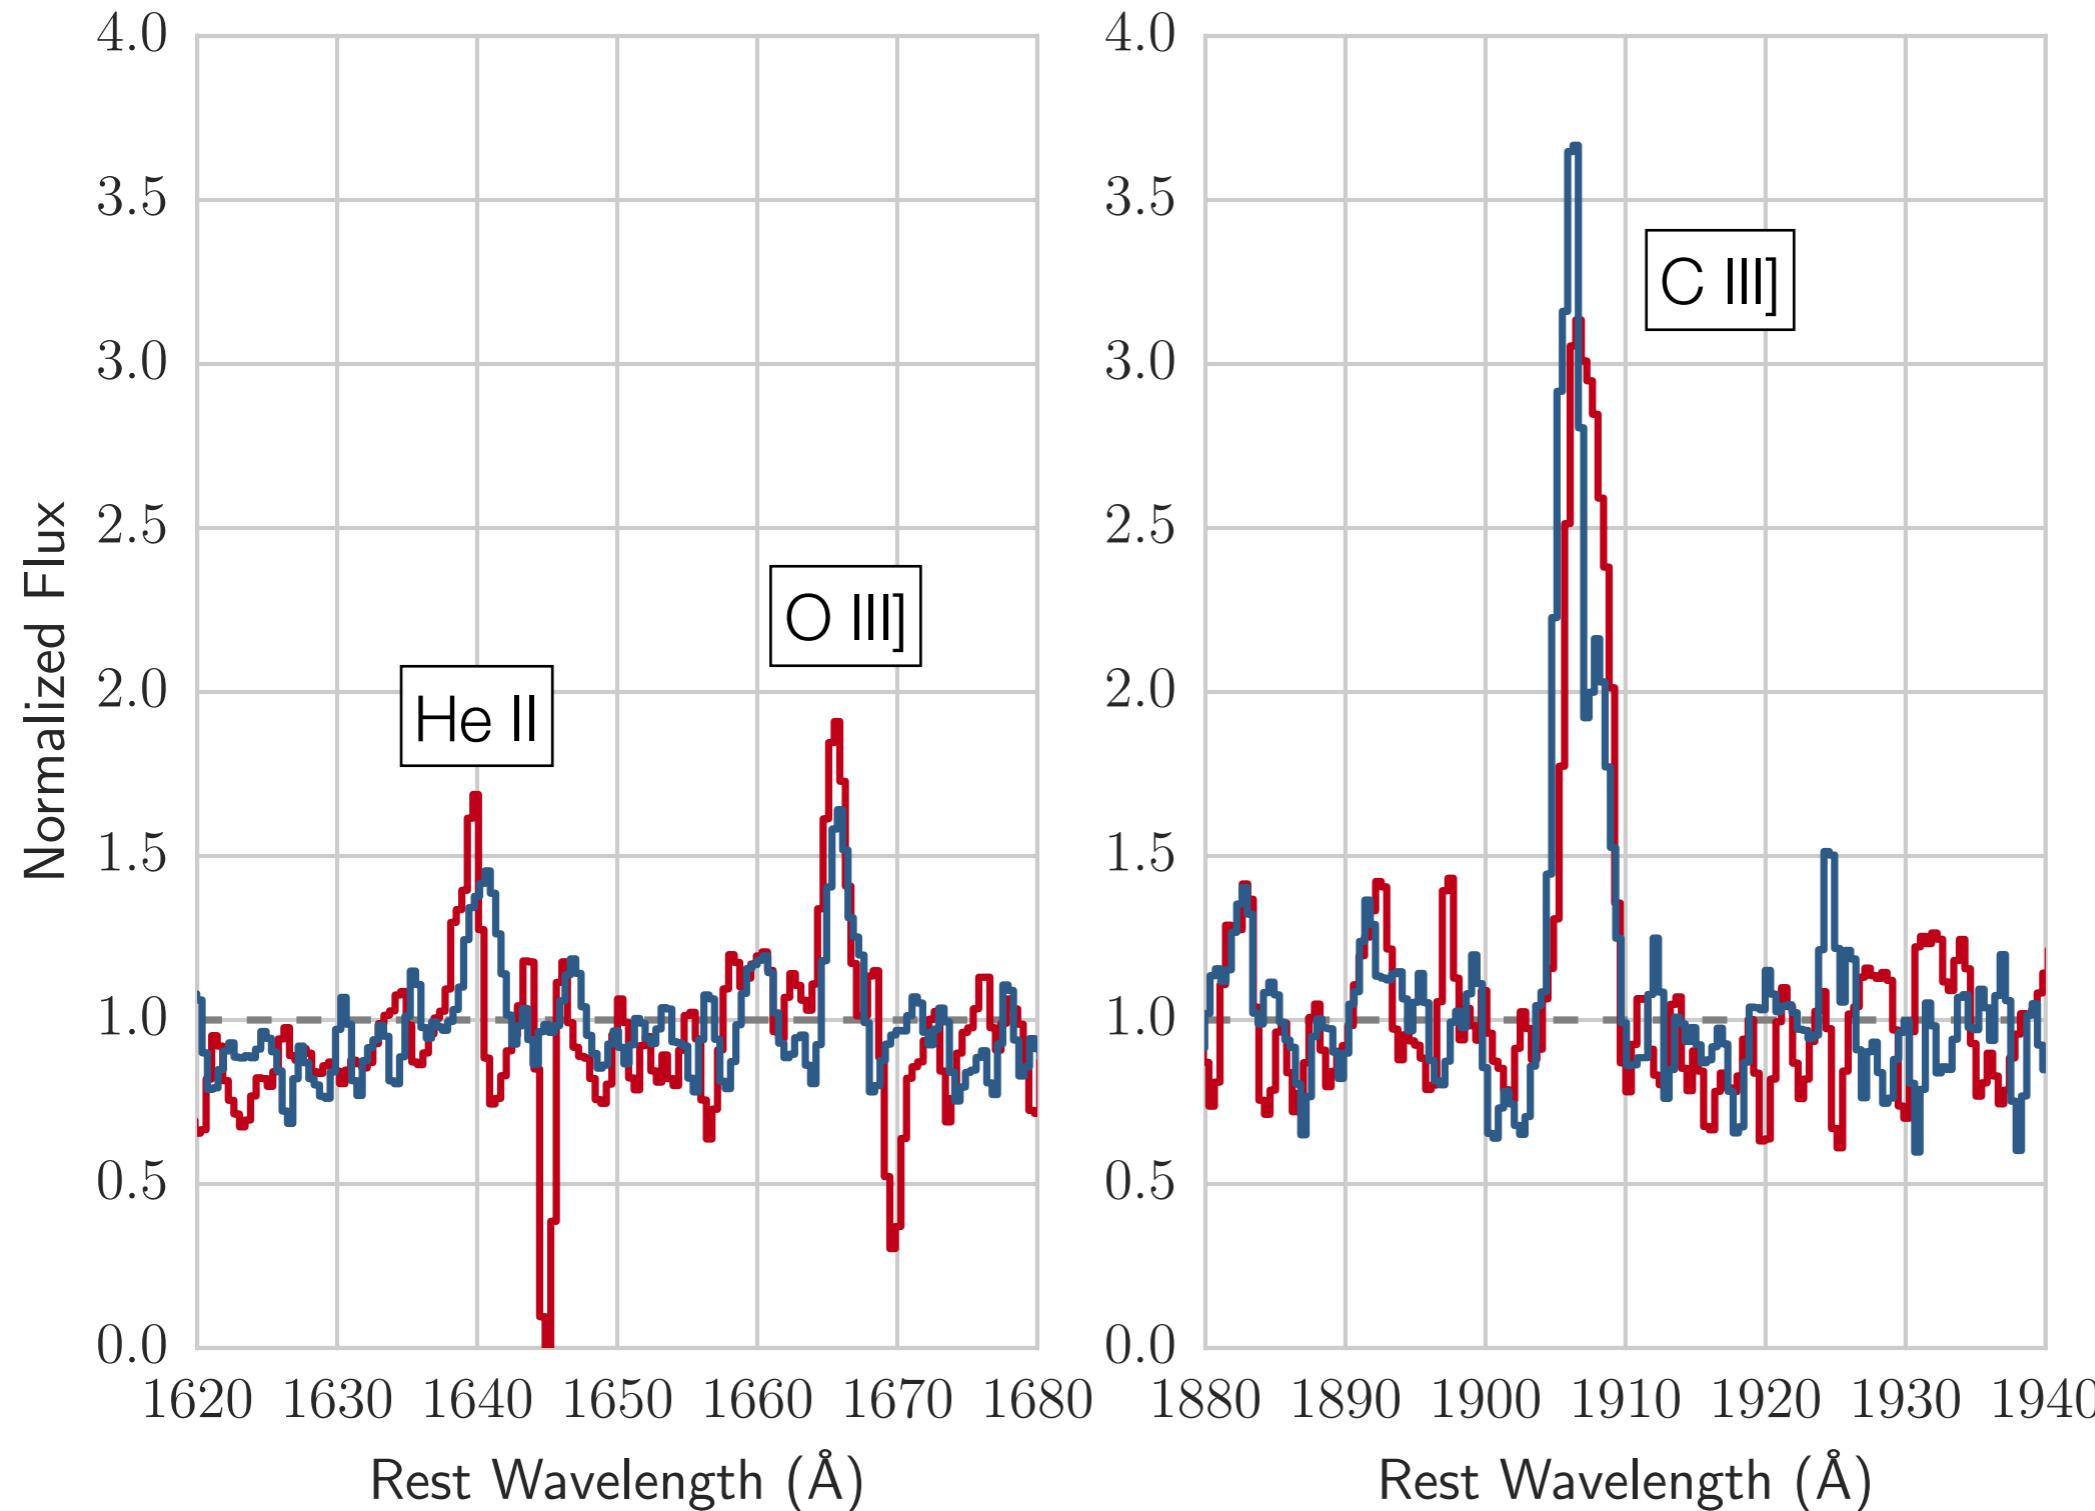

Q2343-BX418
 $M_{\star} = 2 \times 10^9 M_{\odot}$
 $SFR = 50 M_{\odot} \text{ yr}^{-1}$
 $SSFR = 18 \text{ Gyr}^{-1}$
 $12 + \log(\text{O/H}) = 8.08 (\text{T}_e)$
 $\text{O32} = 9.66$

Q2343-BX660
 $M_{\star} = 5 \times 10^9 M_{\odot}$
 $SFR = 23 M_{\odot} \text{ yr}^{-1}$
 $SSFR = 4 \text{ Gyr}^{-1}$
 $12 + \log(\text{O/H}) = 8.13 (\text{T}_e)$
 $\text{O32} = 10.98$

O/H, O32 from Steidel et al 2014

Strong UV emission lines

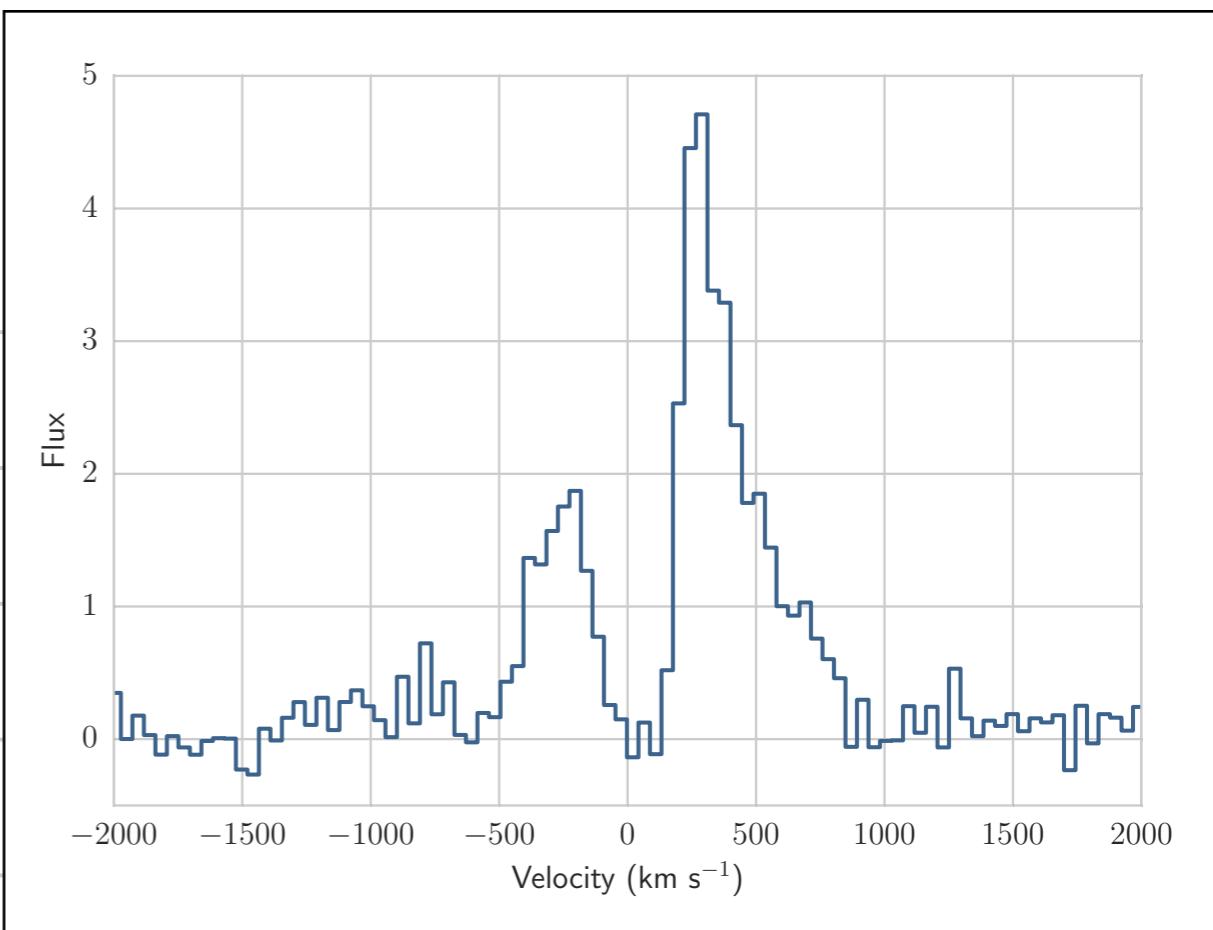

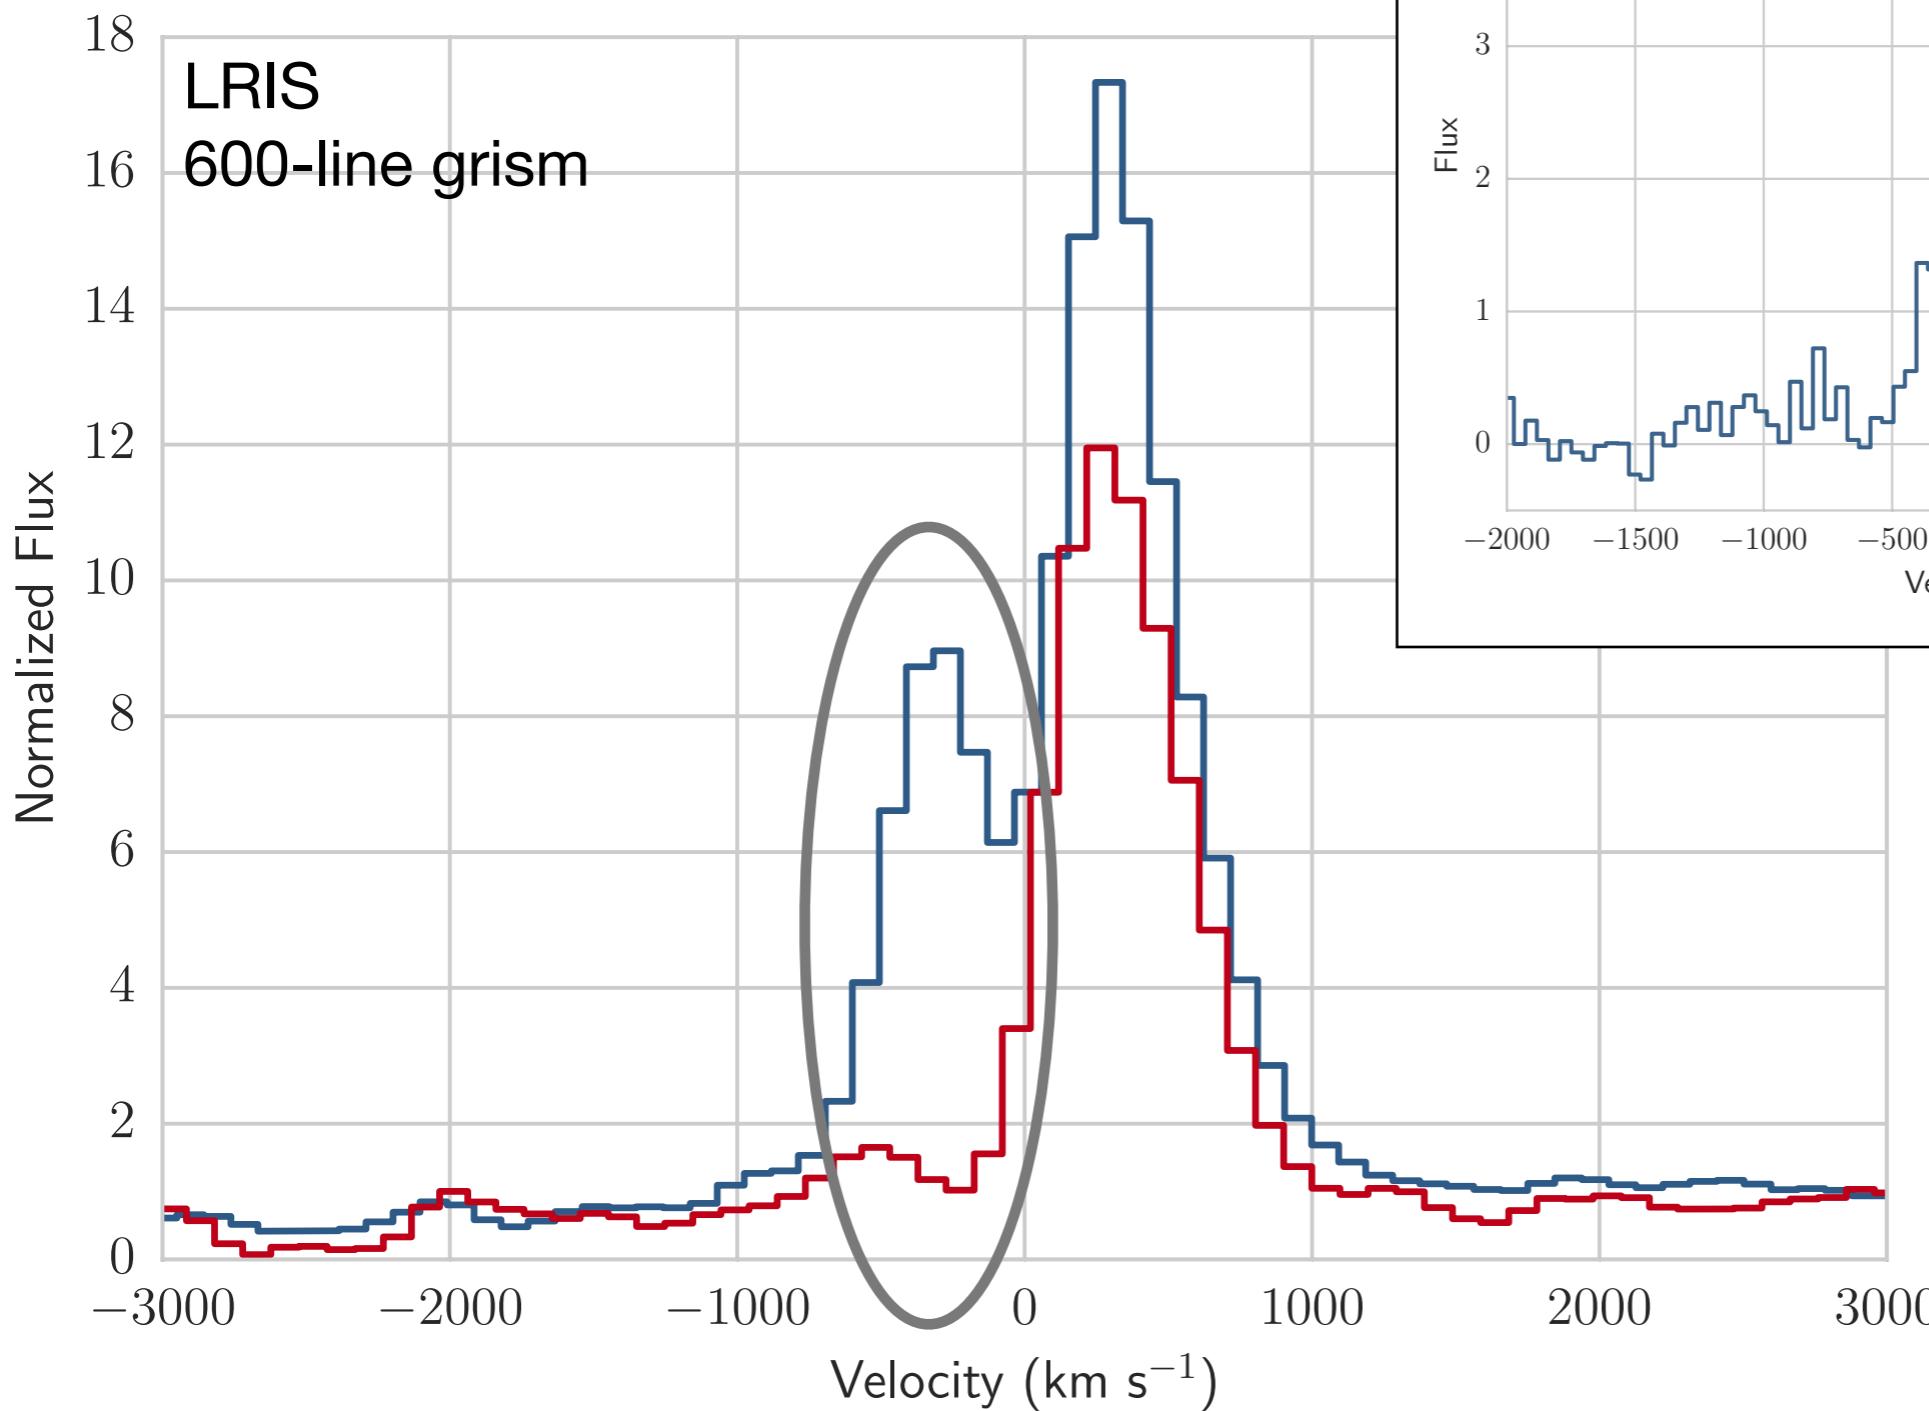

BX418
BX660

Lya emission profiles

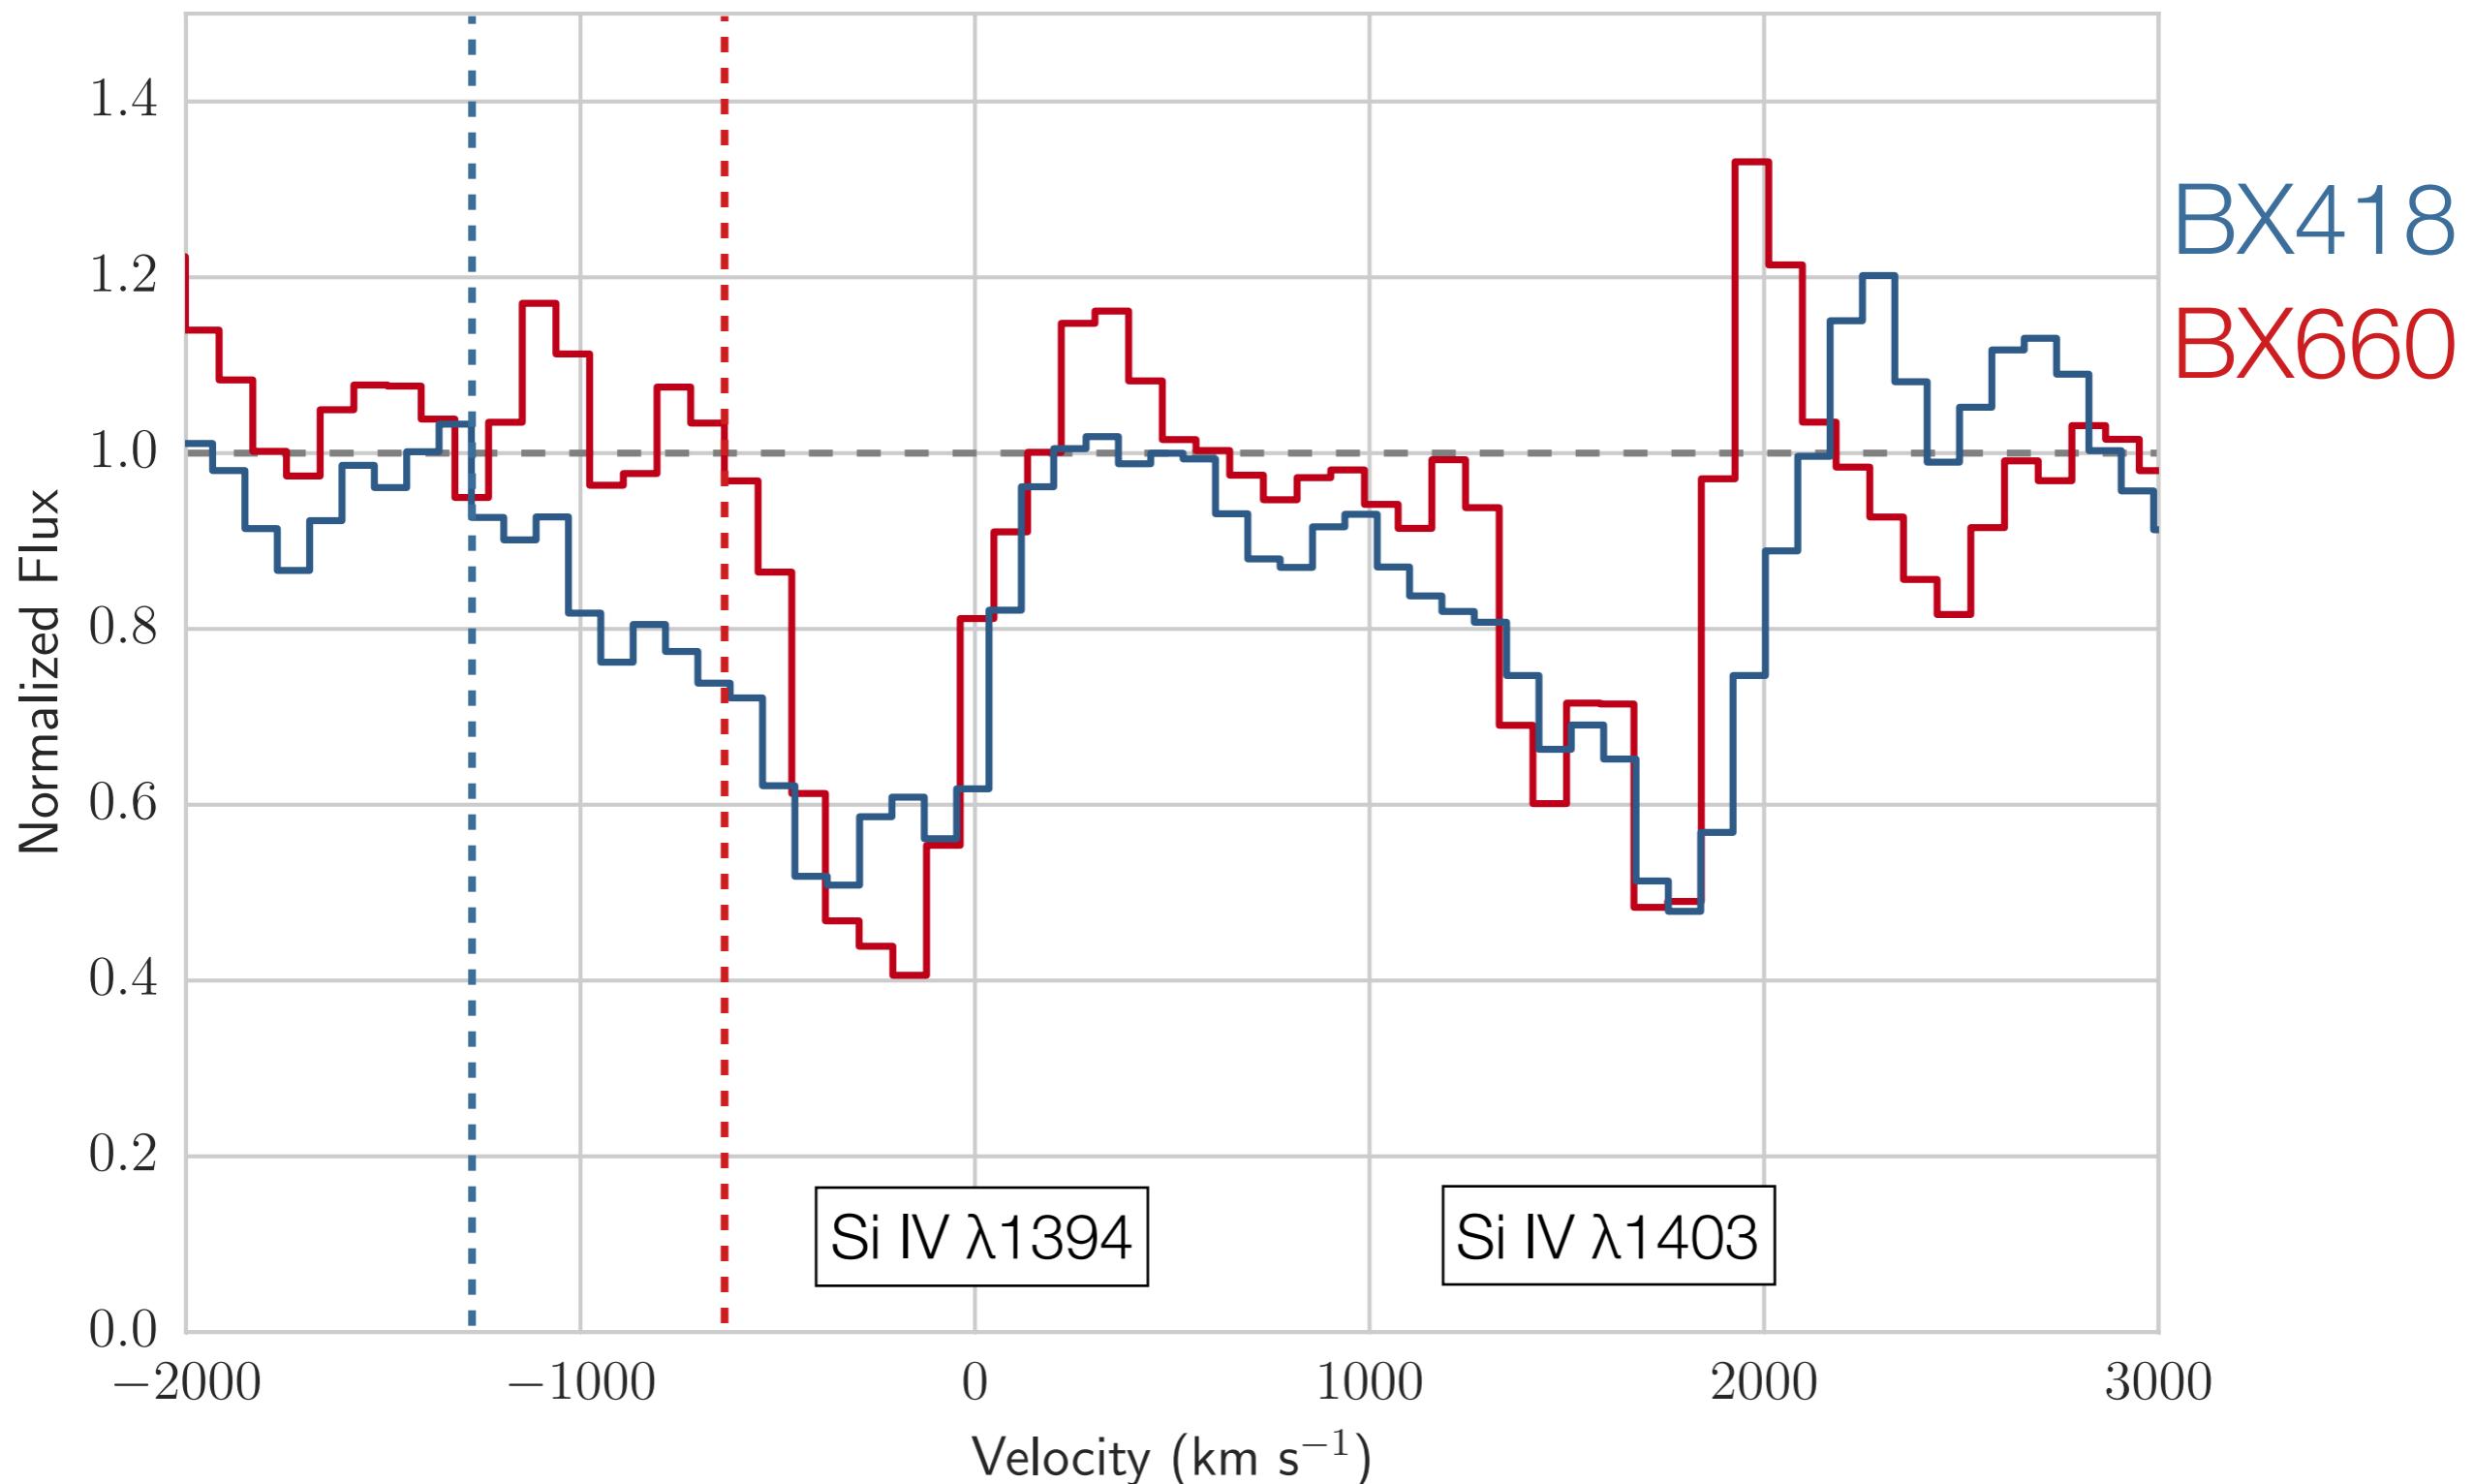

BX418 with VLT XSHOOTER

R=6200

Archival data, Terlevich et al 2015

High ionization absorption lines vary in velocity

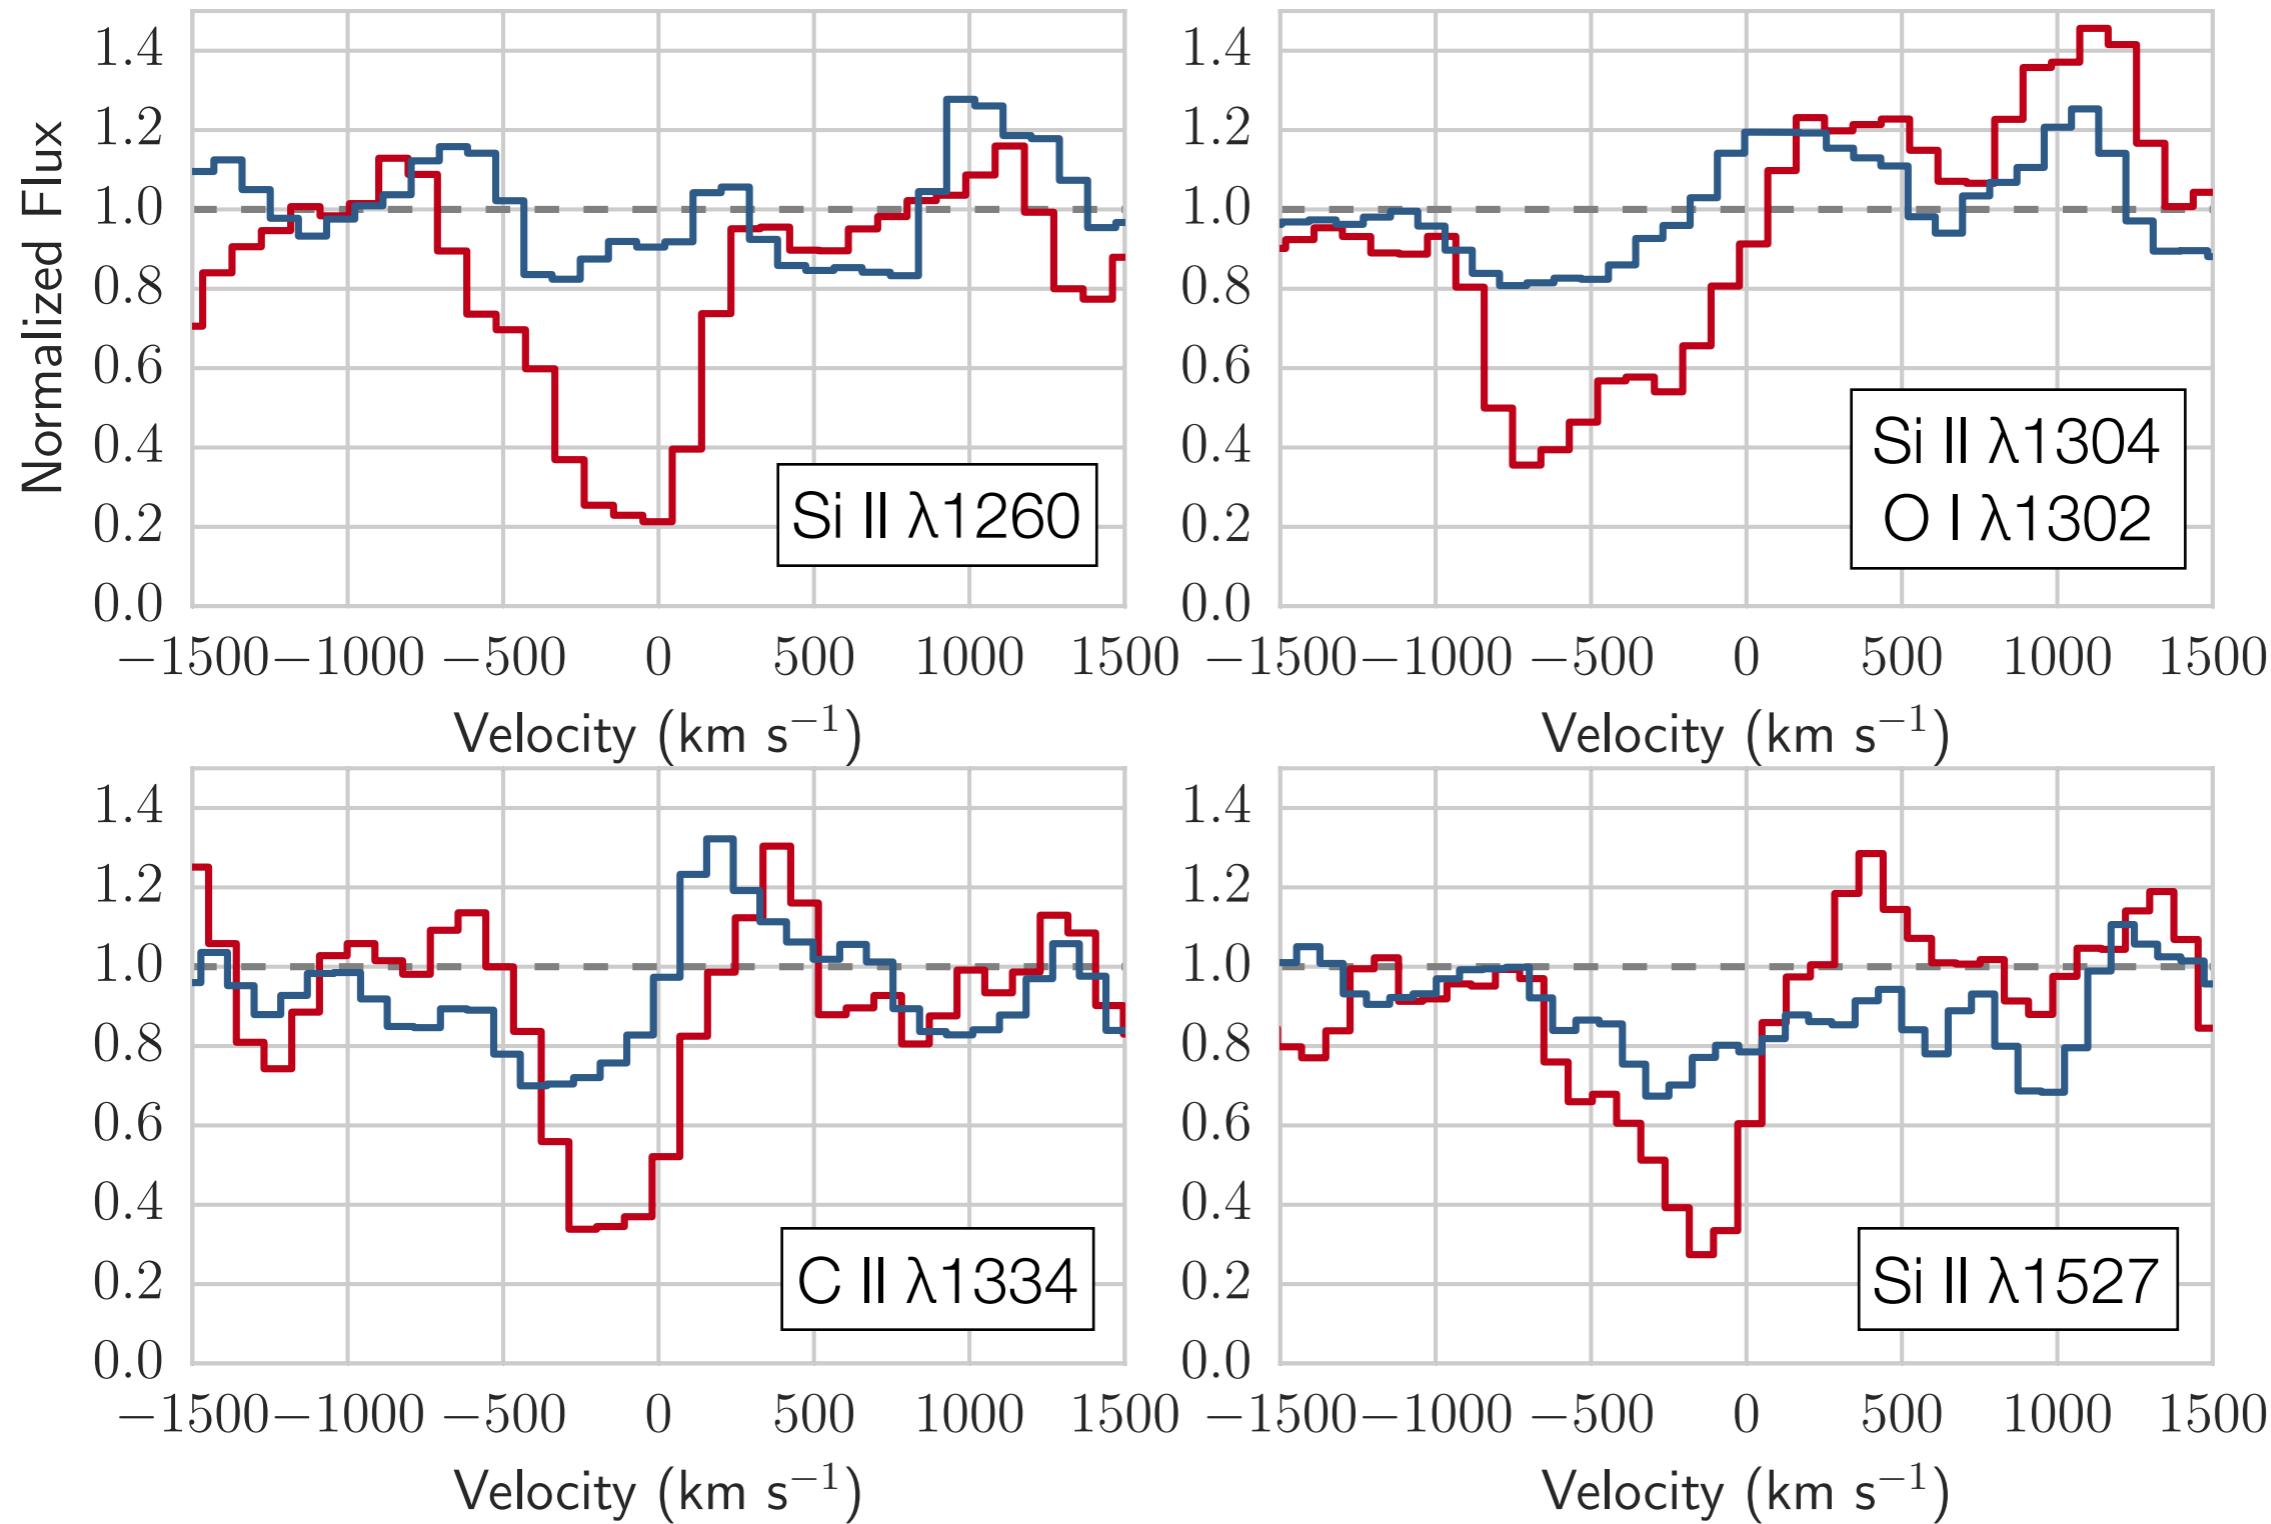

Maximum blueshifted velocities:

$\sim 1300 \text{ km s}^{-1}$ (BX418), $\sim 600 \text{ km s}^{-1}$ (BX660)

Erb et al in prep

Low ionization absorption lines vary in strength

BX660: much stronger low ionization absorption

BX418 vs BX660: implications

Galaxies with similar metallicities, masses, morphologies and extreme emission line ratios may have significantly different outflow properties and Ly α profiles

See talk by Anne Jaskot

Likely due to geometry, covering fraction/column density of neutral hydrogen

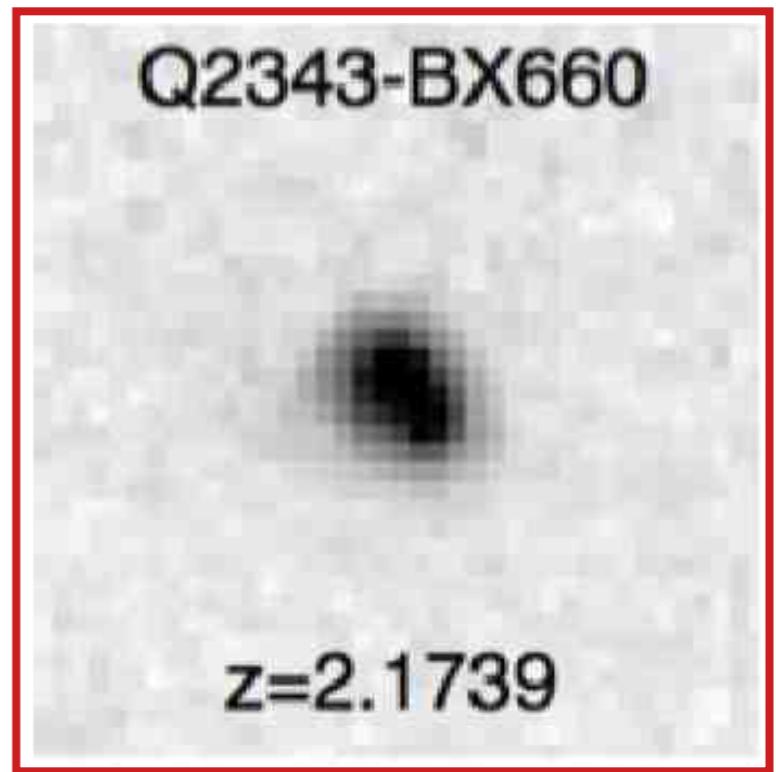

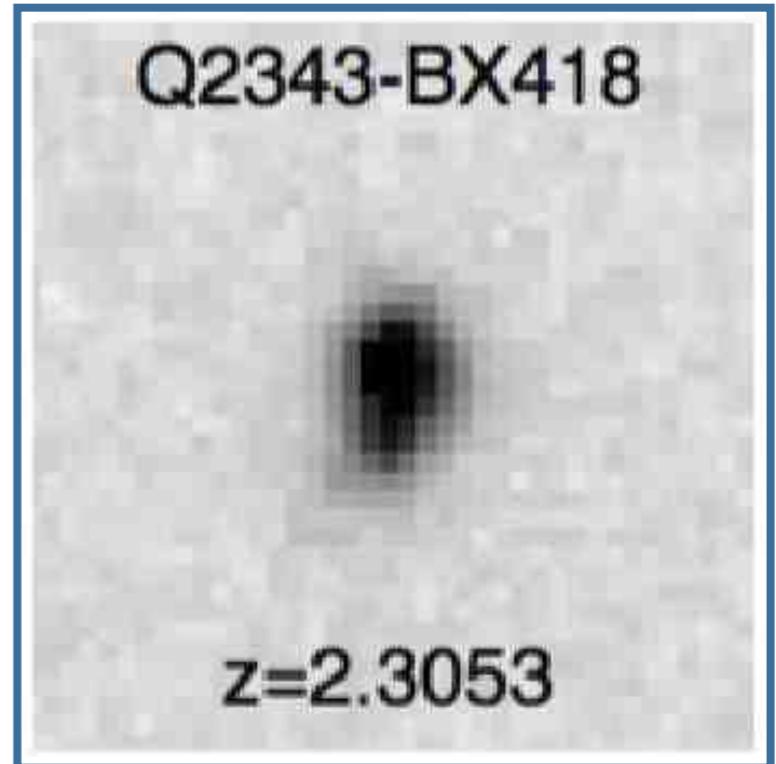

Signatures of most extreme objects:

High velocity, highly ionized outflow

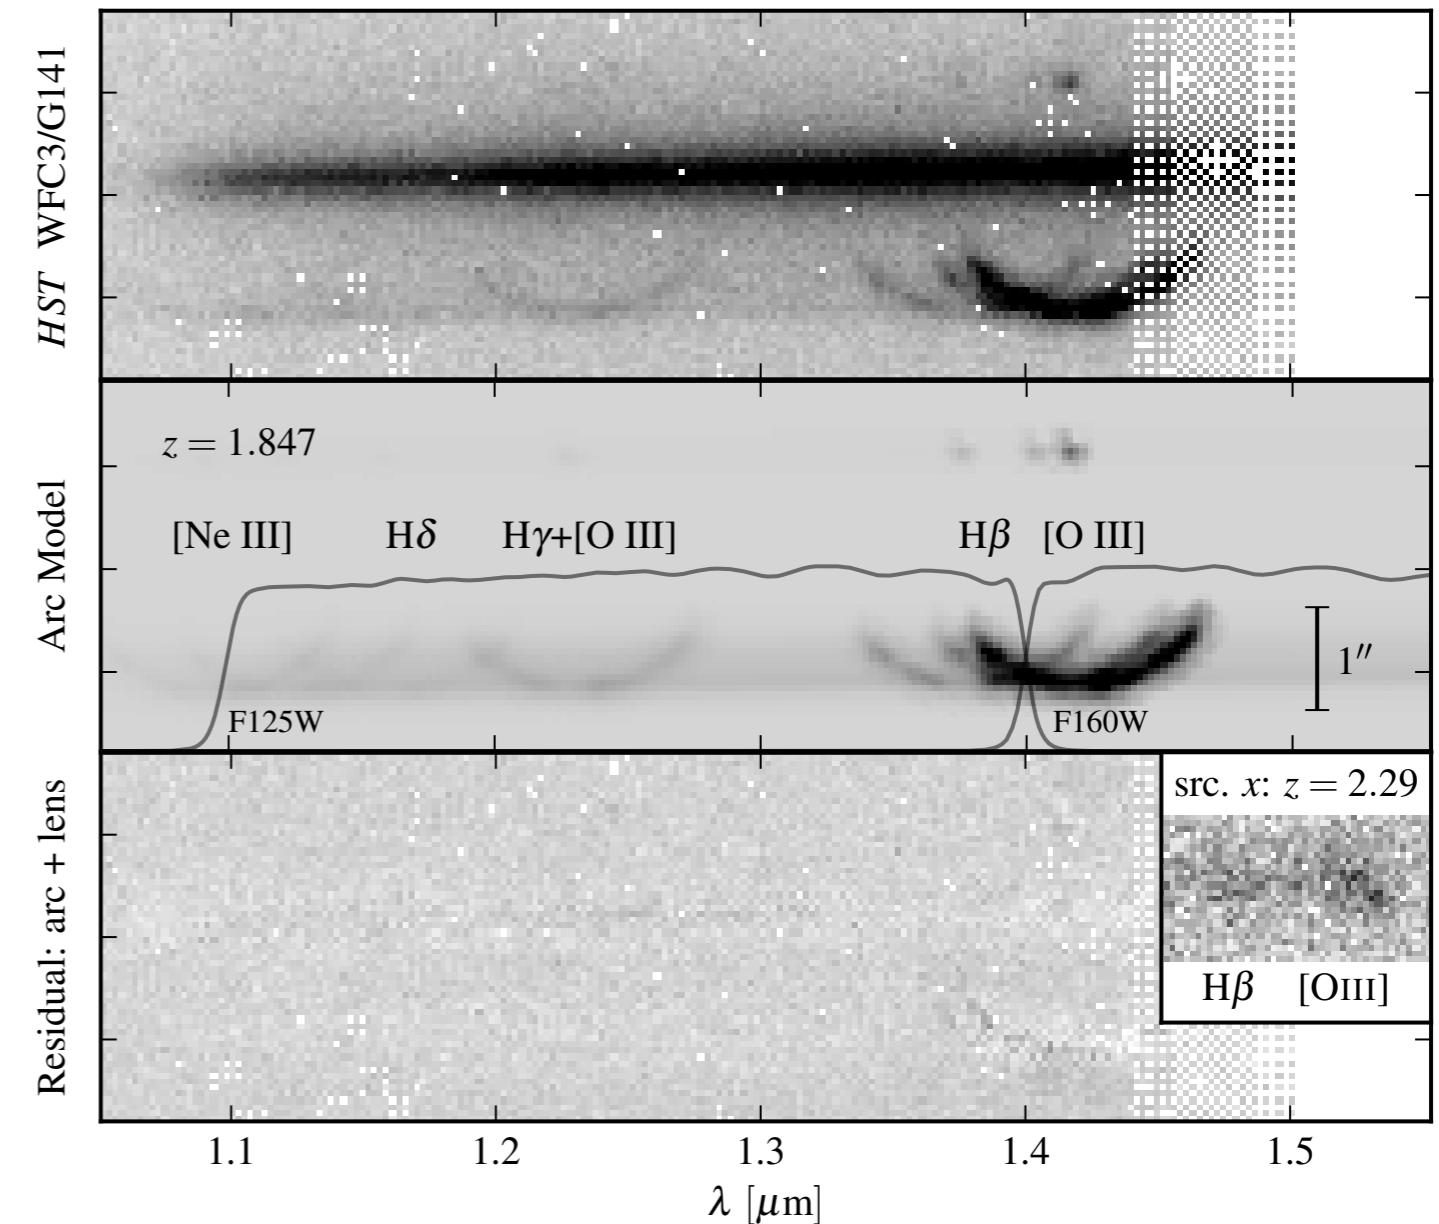

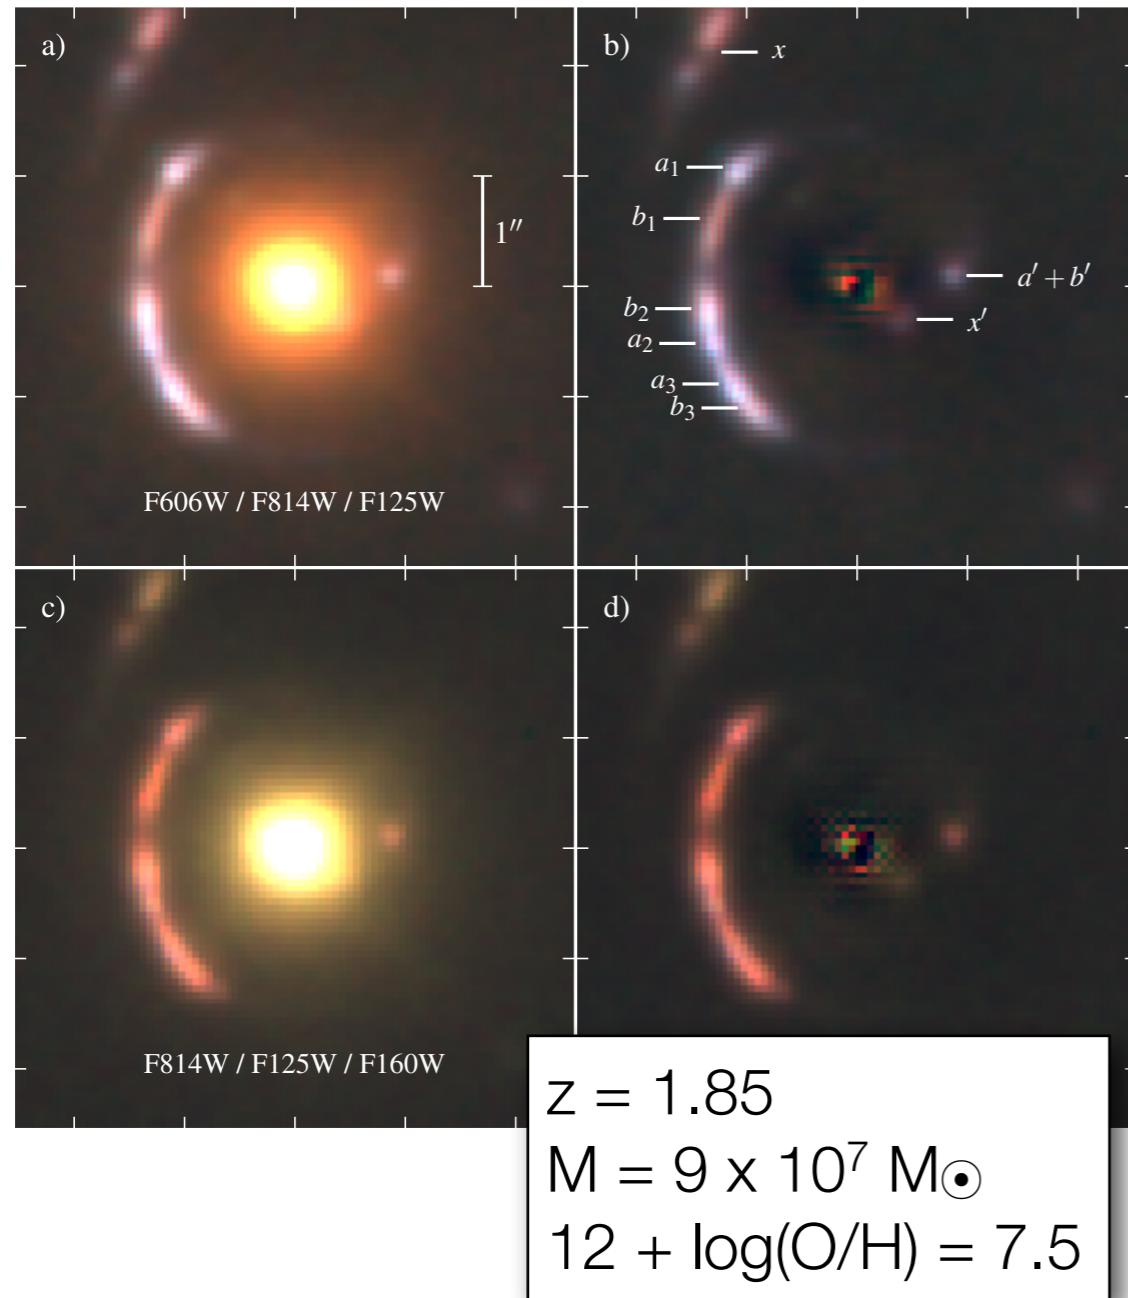

Weak low ionization absorption: low covering fraction of neutral gas

Blueshifted Ly α emission

Most likely LyC emitters?

A low mass, low metallicity lensed galaxy at z~2

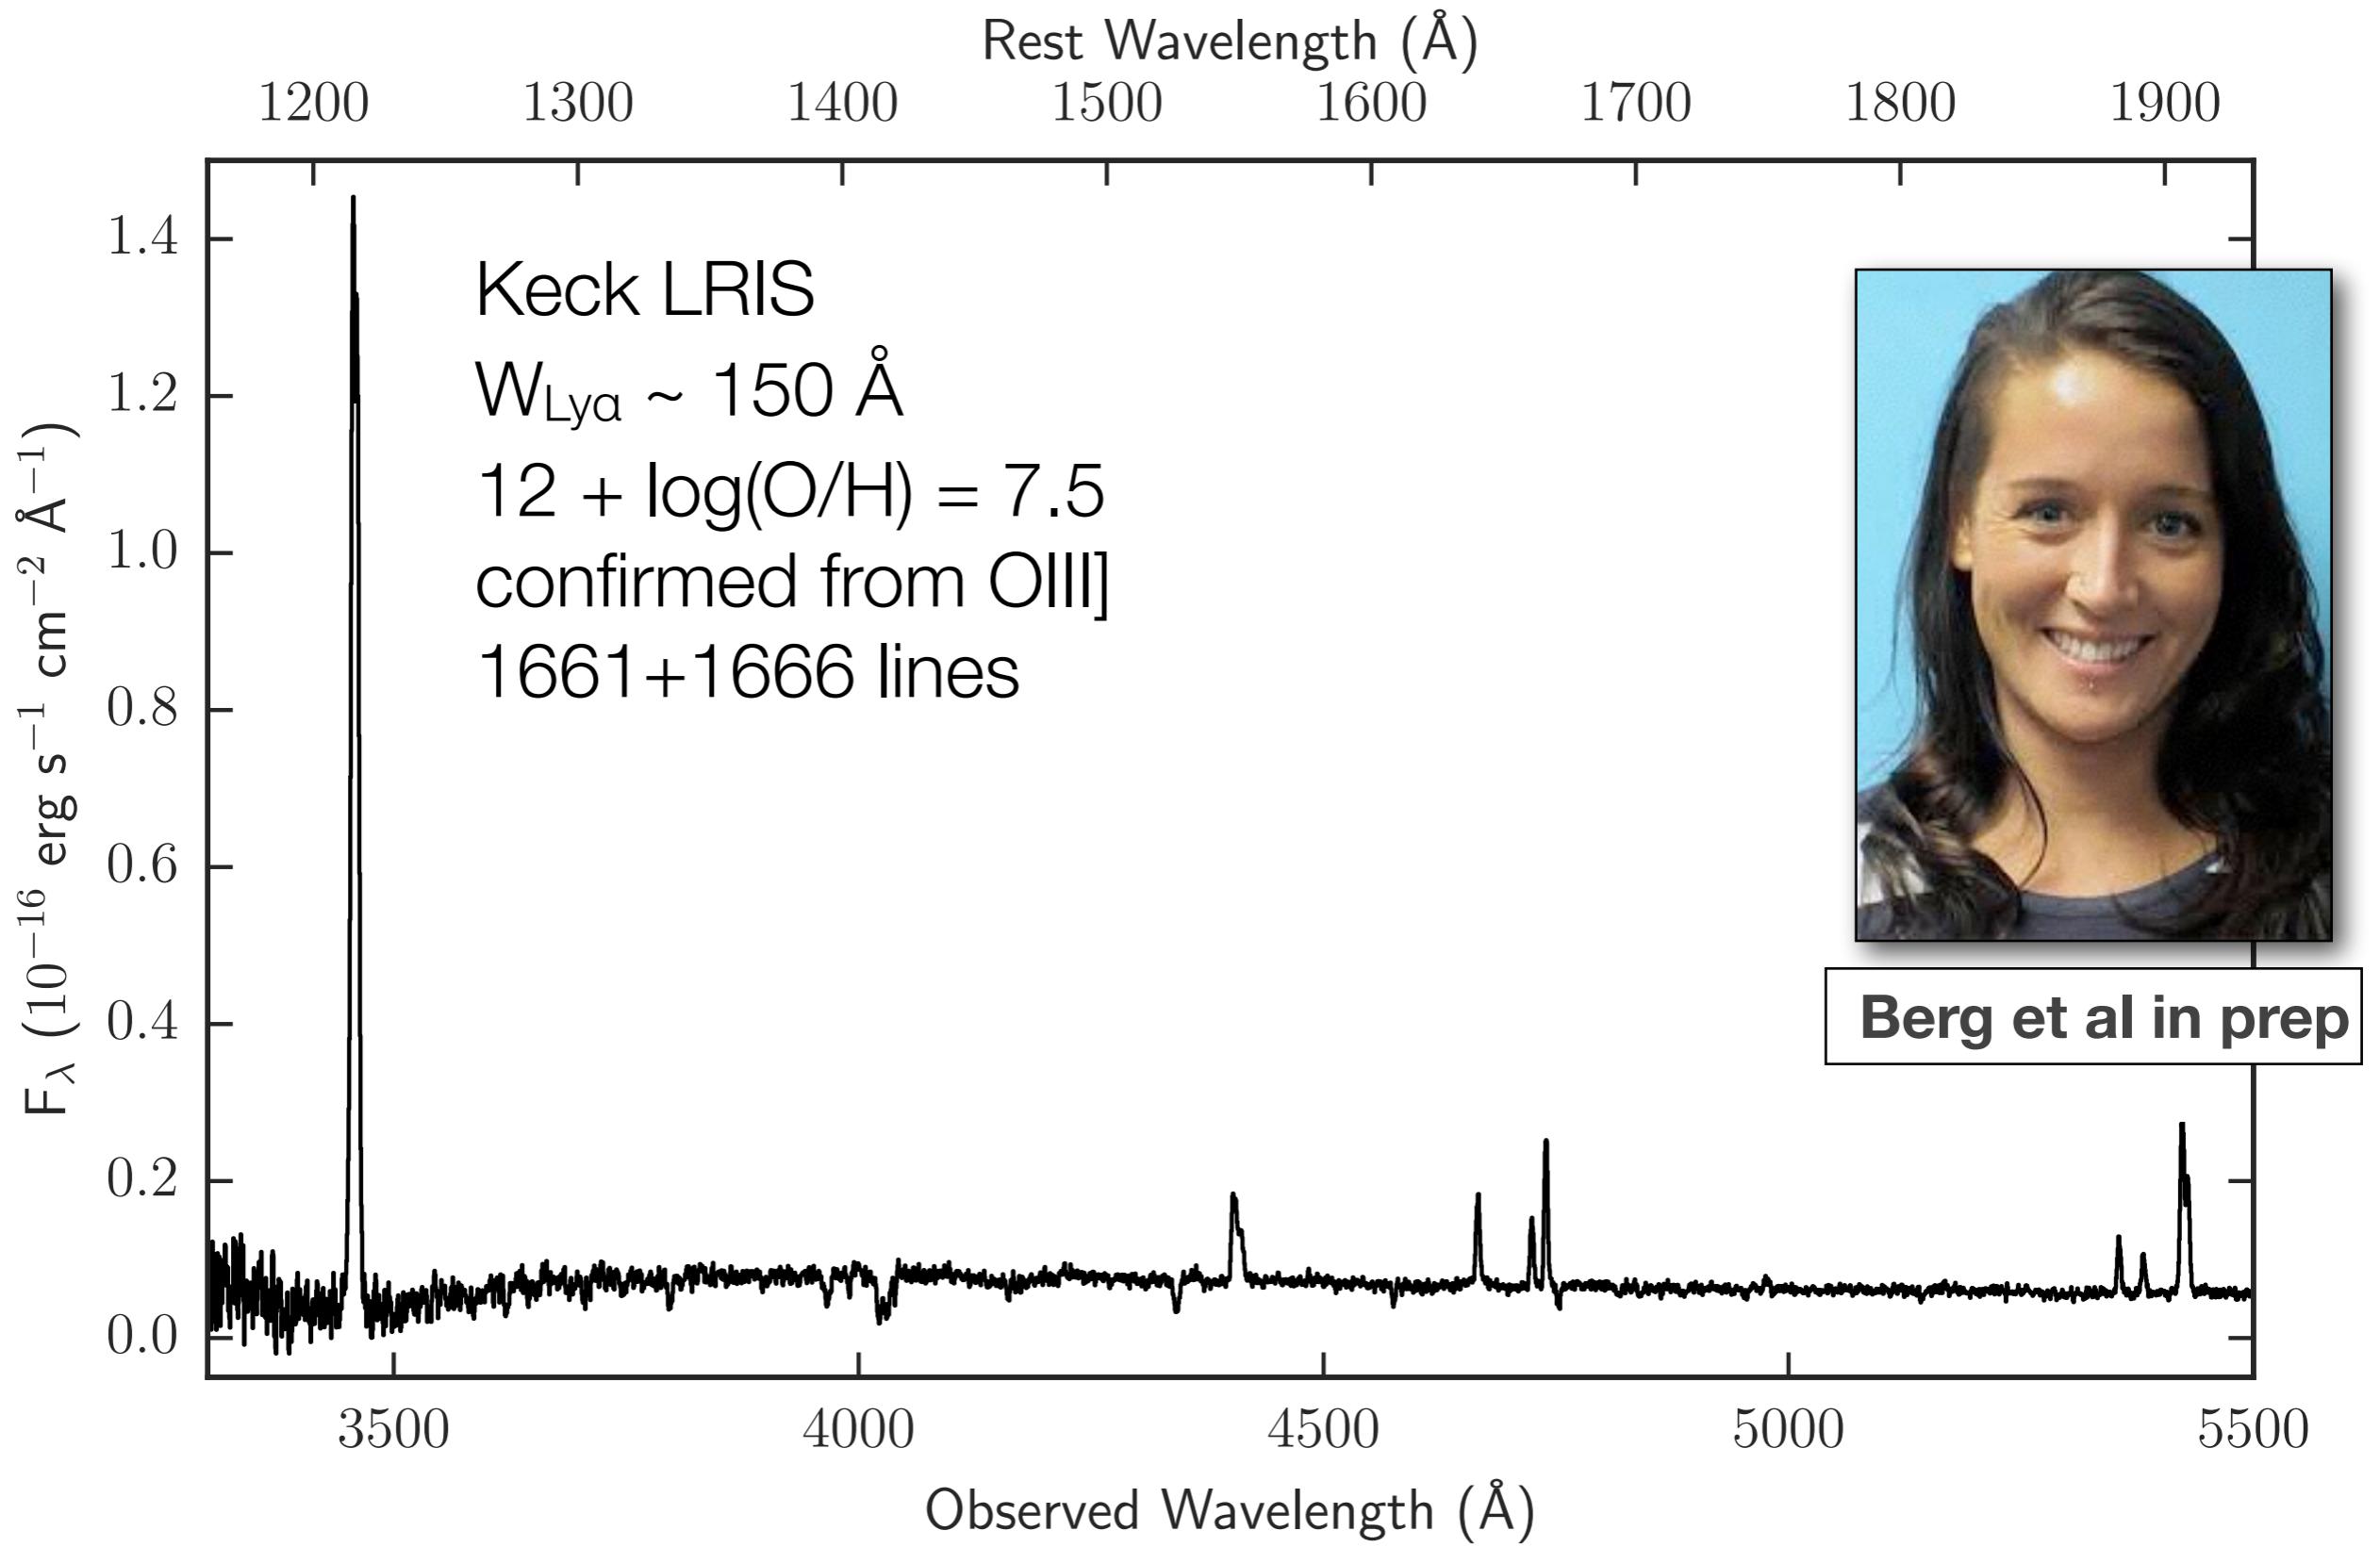

Rest-frame optical spectrum from 3DHST grism survey (Brammer et al 2012)

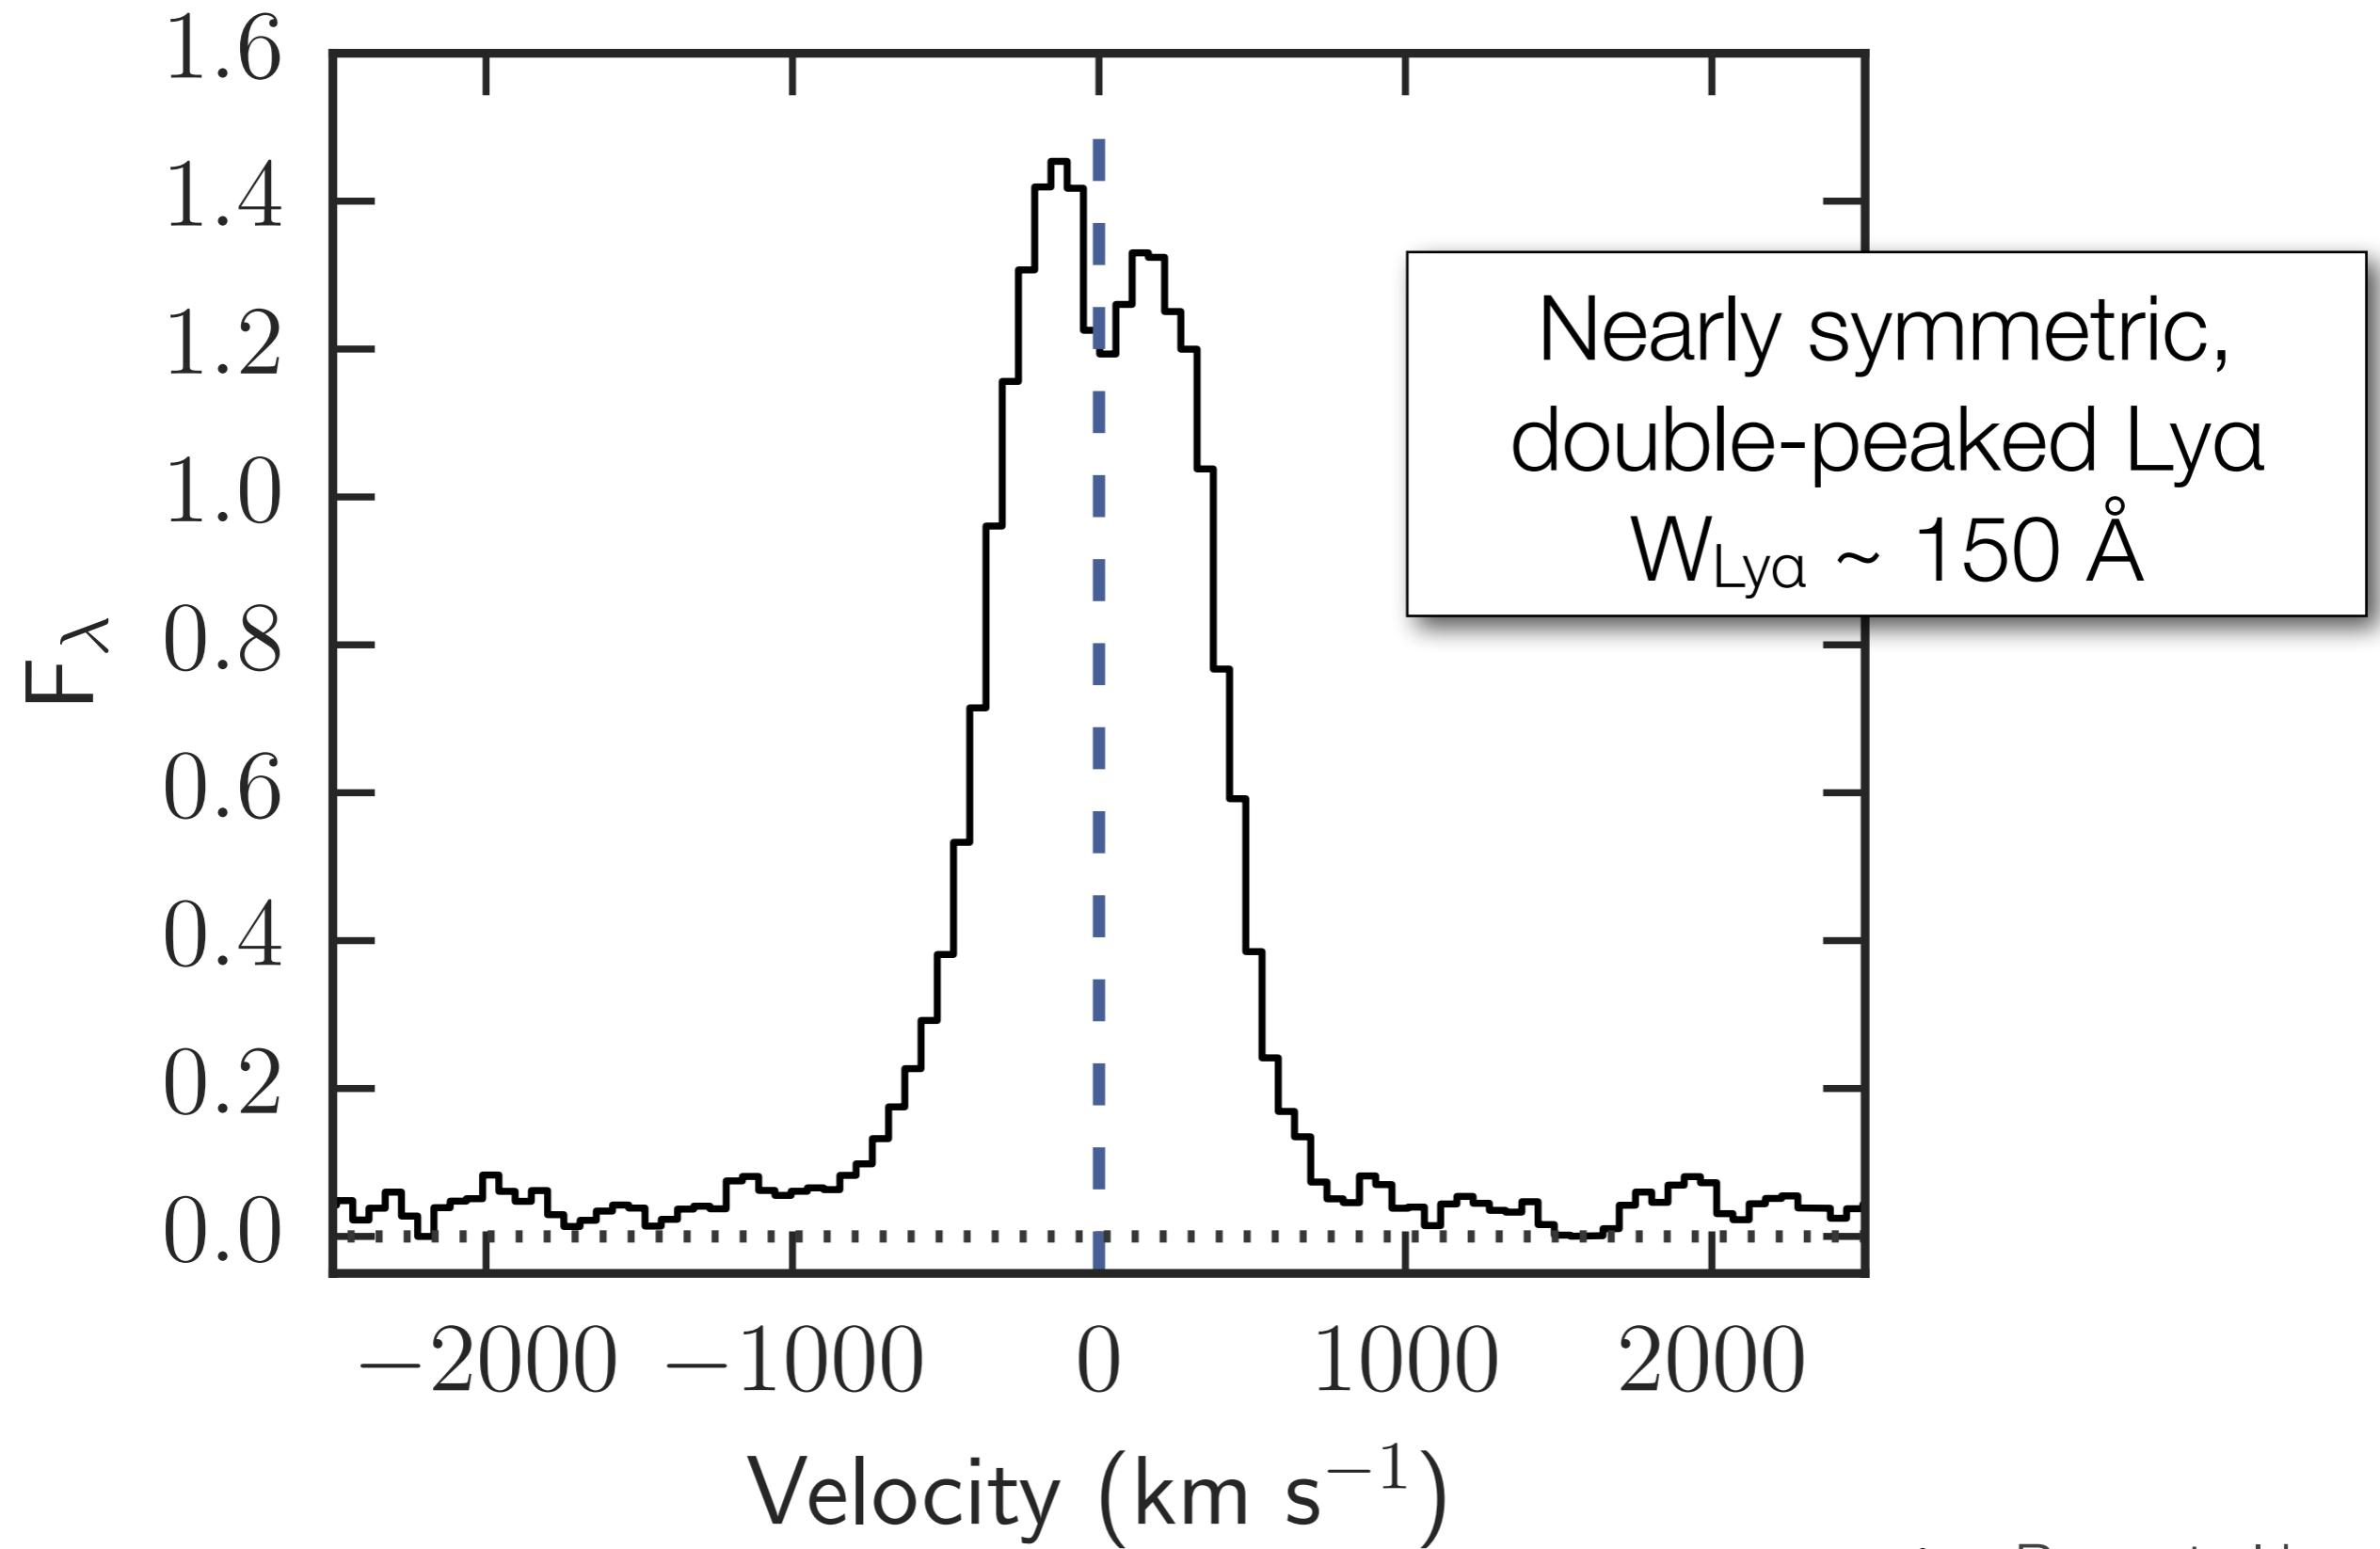

Very high EW [OIII] ($\sim 2000 \text{ \AA}$ rest-frame) and H β emission ($\sim 500 \text{ \AA}$)

Very high sSFR $\sim 100 \text{ Gyr}^{-1}$ ($\sim 8 \text{ Myr}$ to form all stars at current rate)

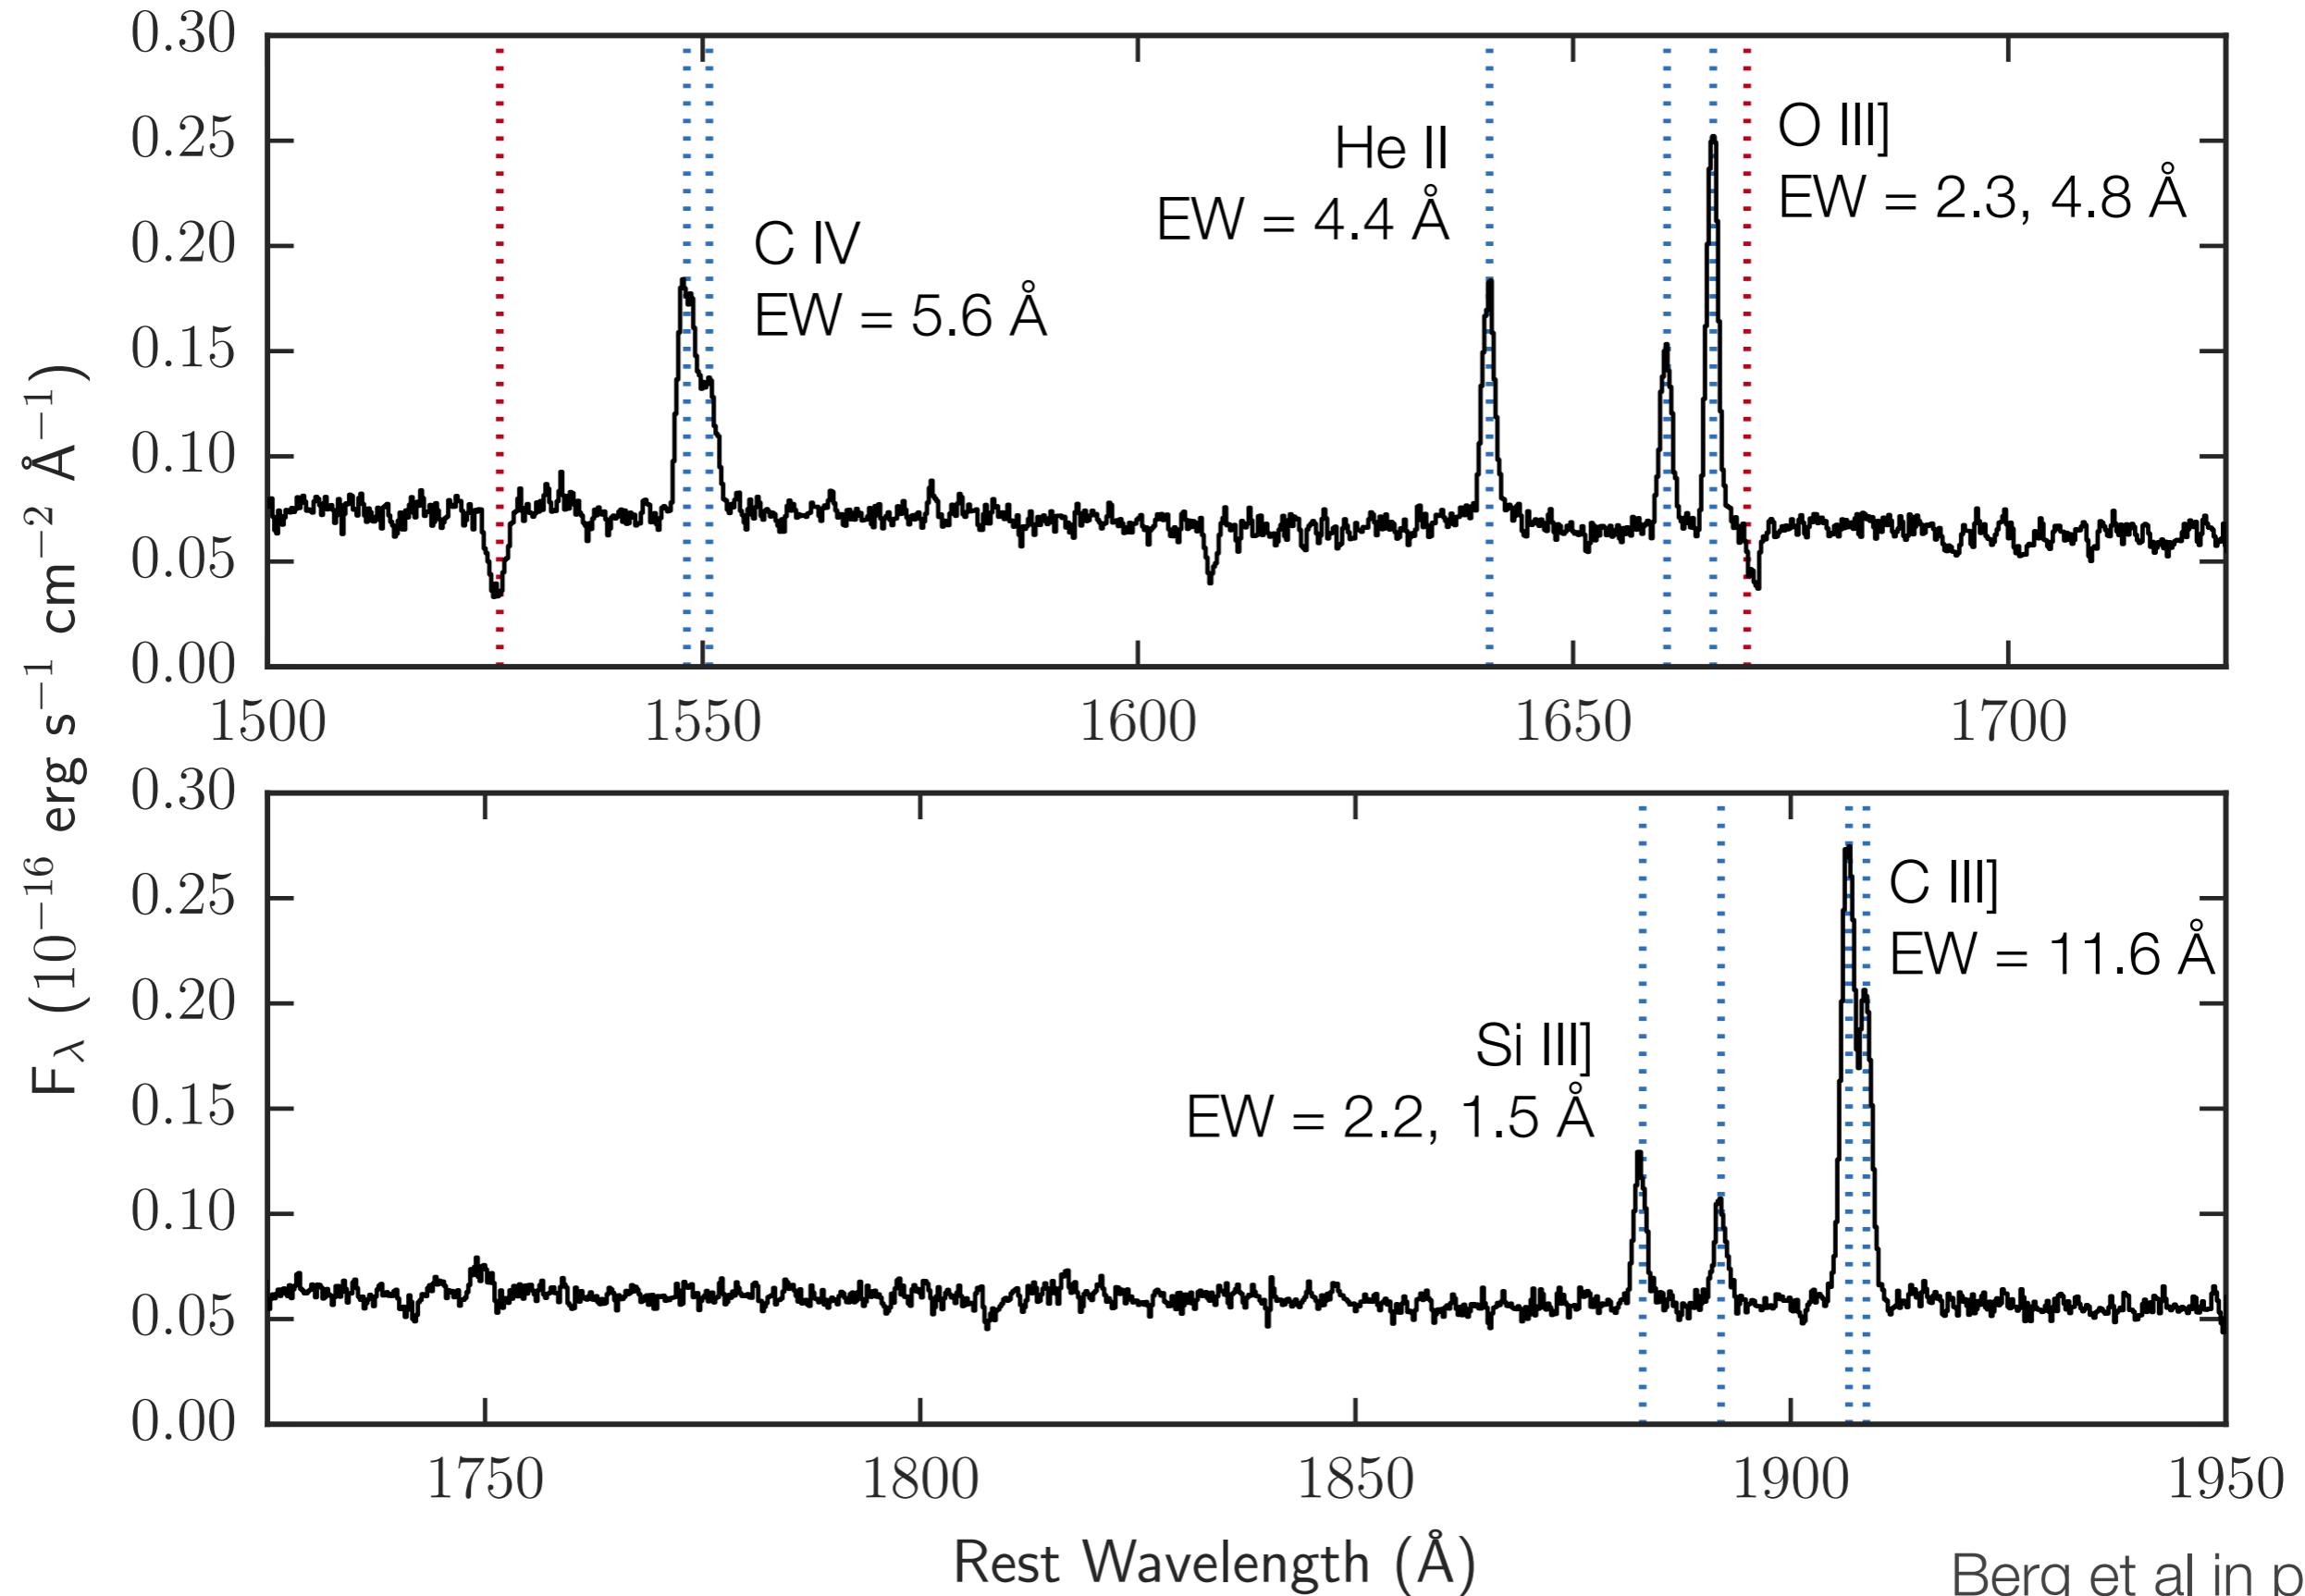

Rest-frame UV spectrum

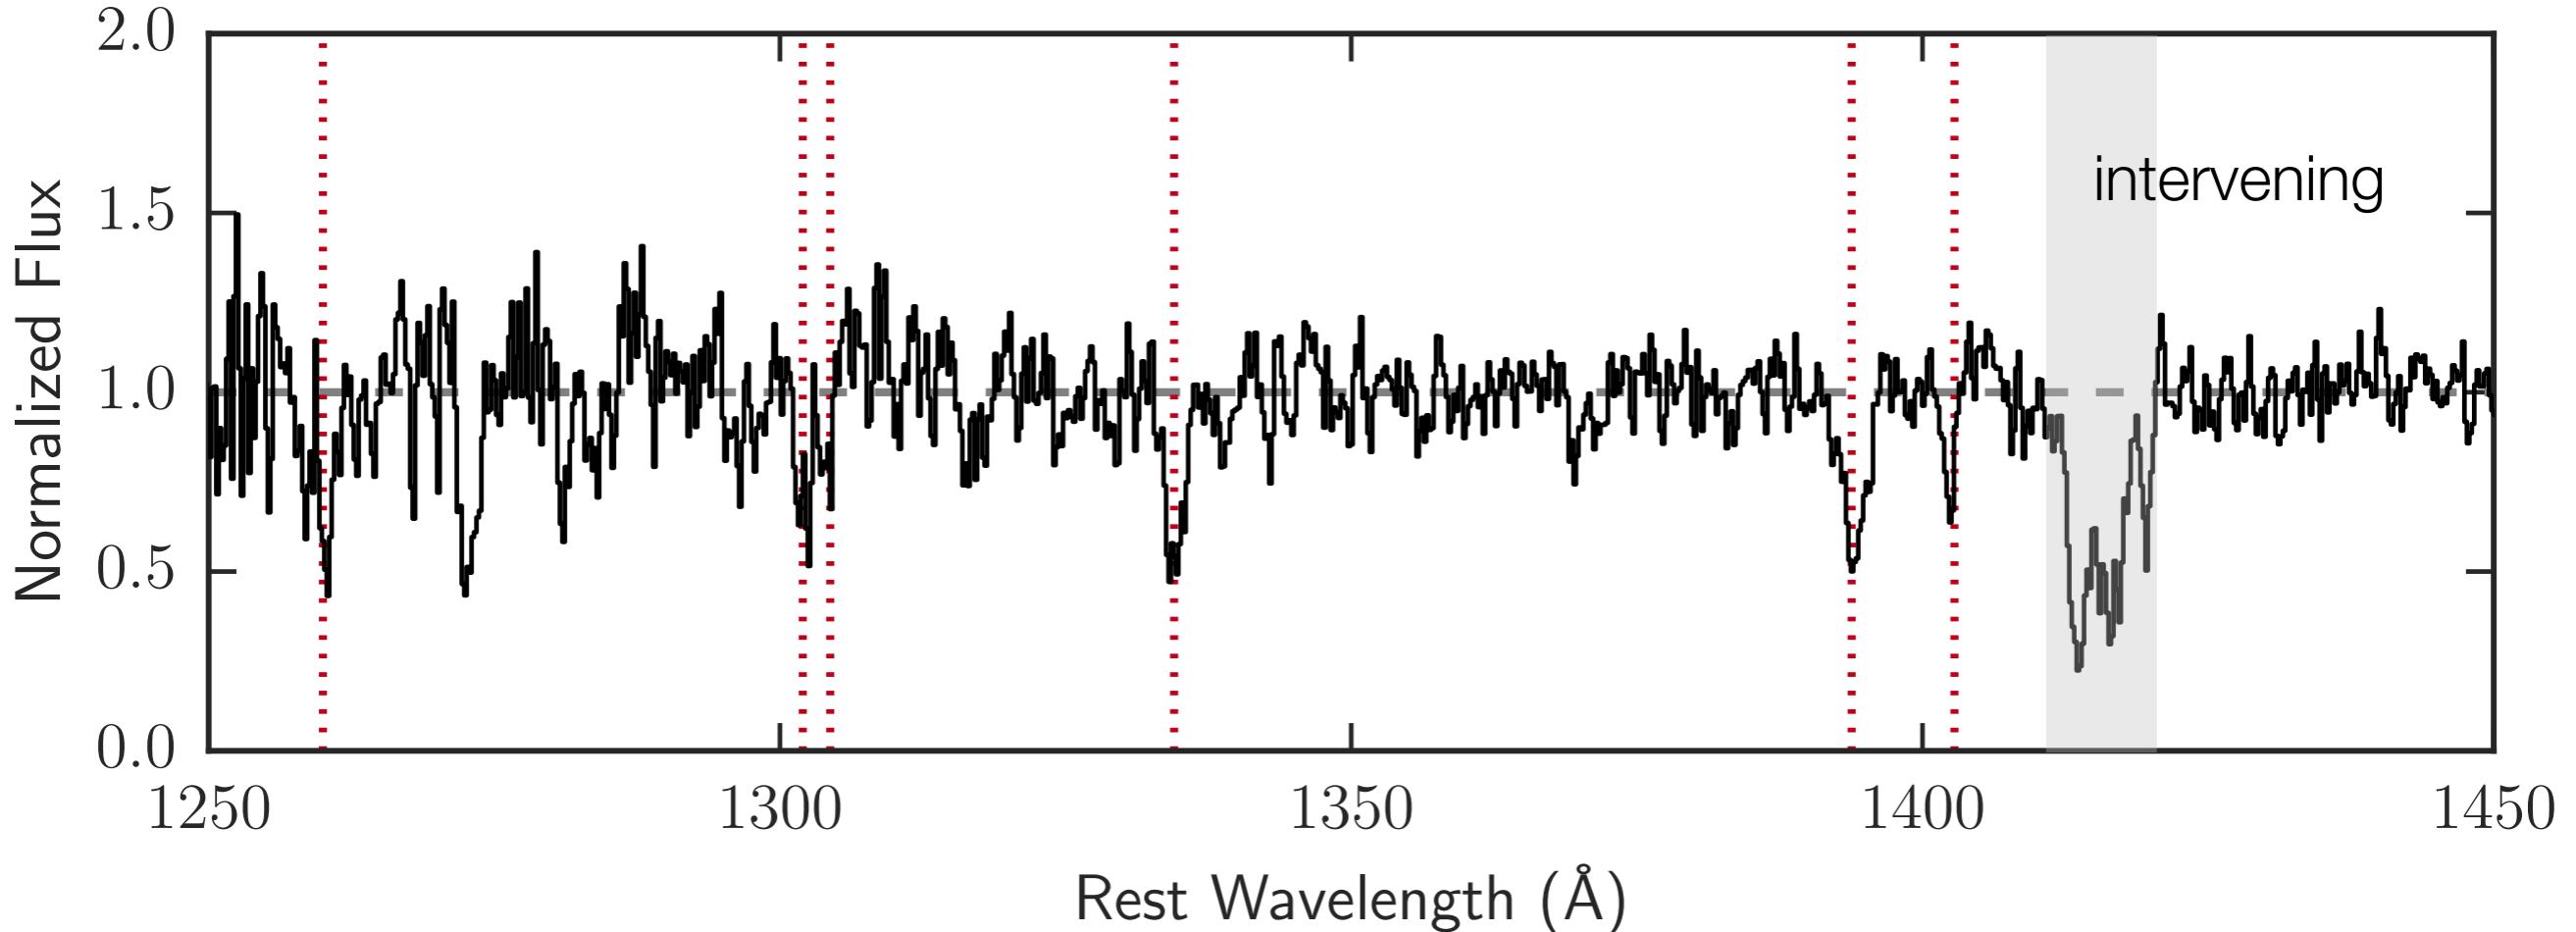

Lya emission

Strong UV emission lines

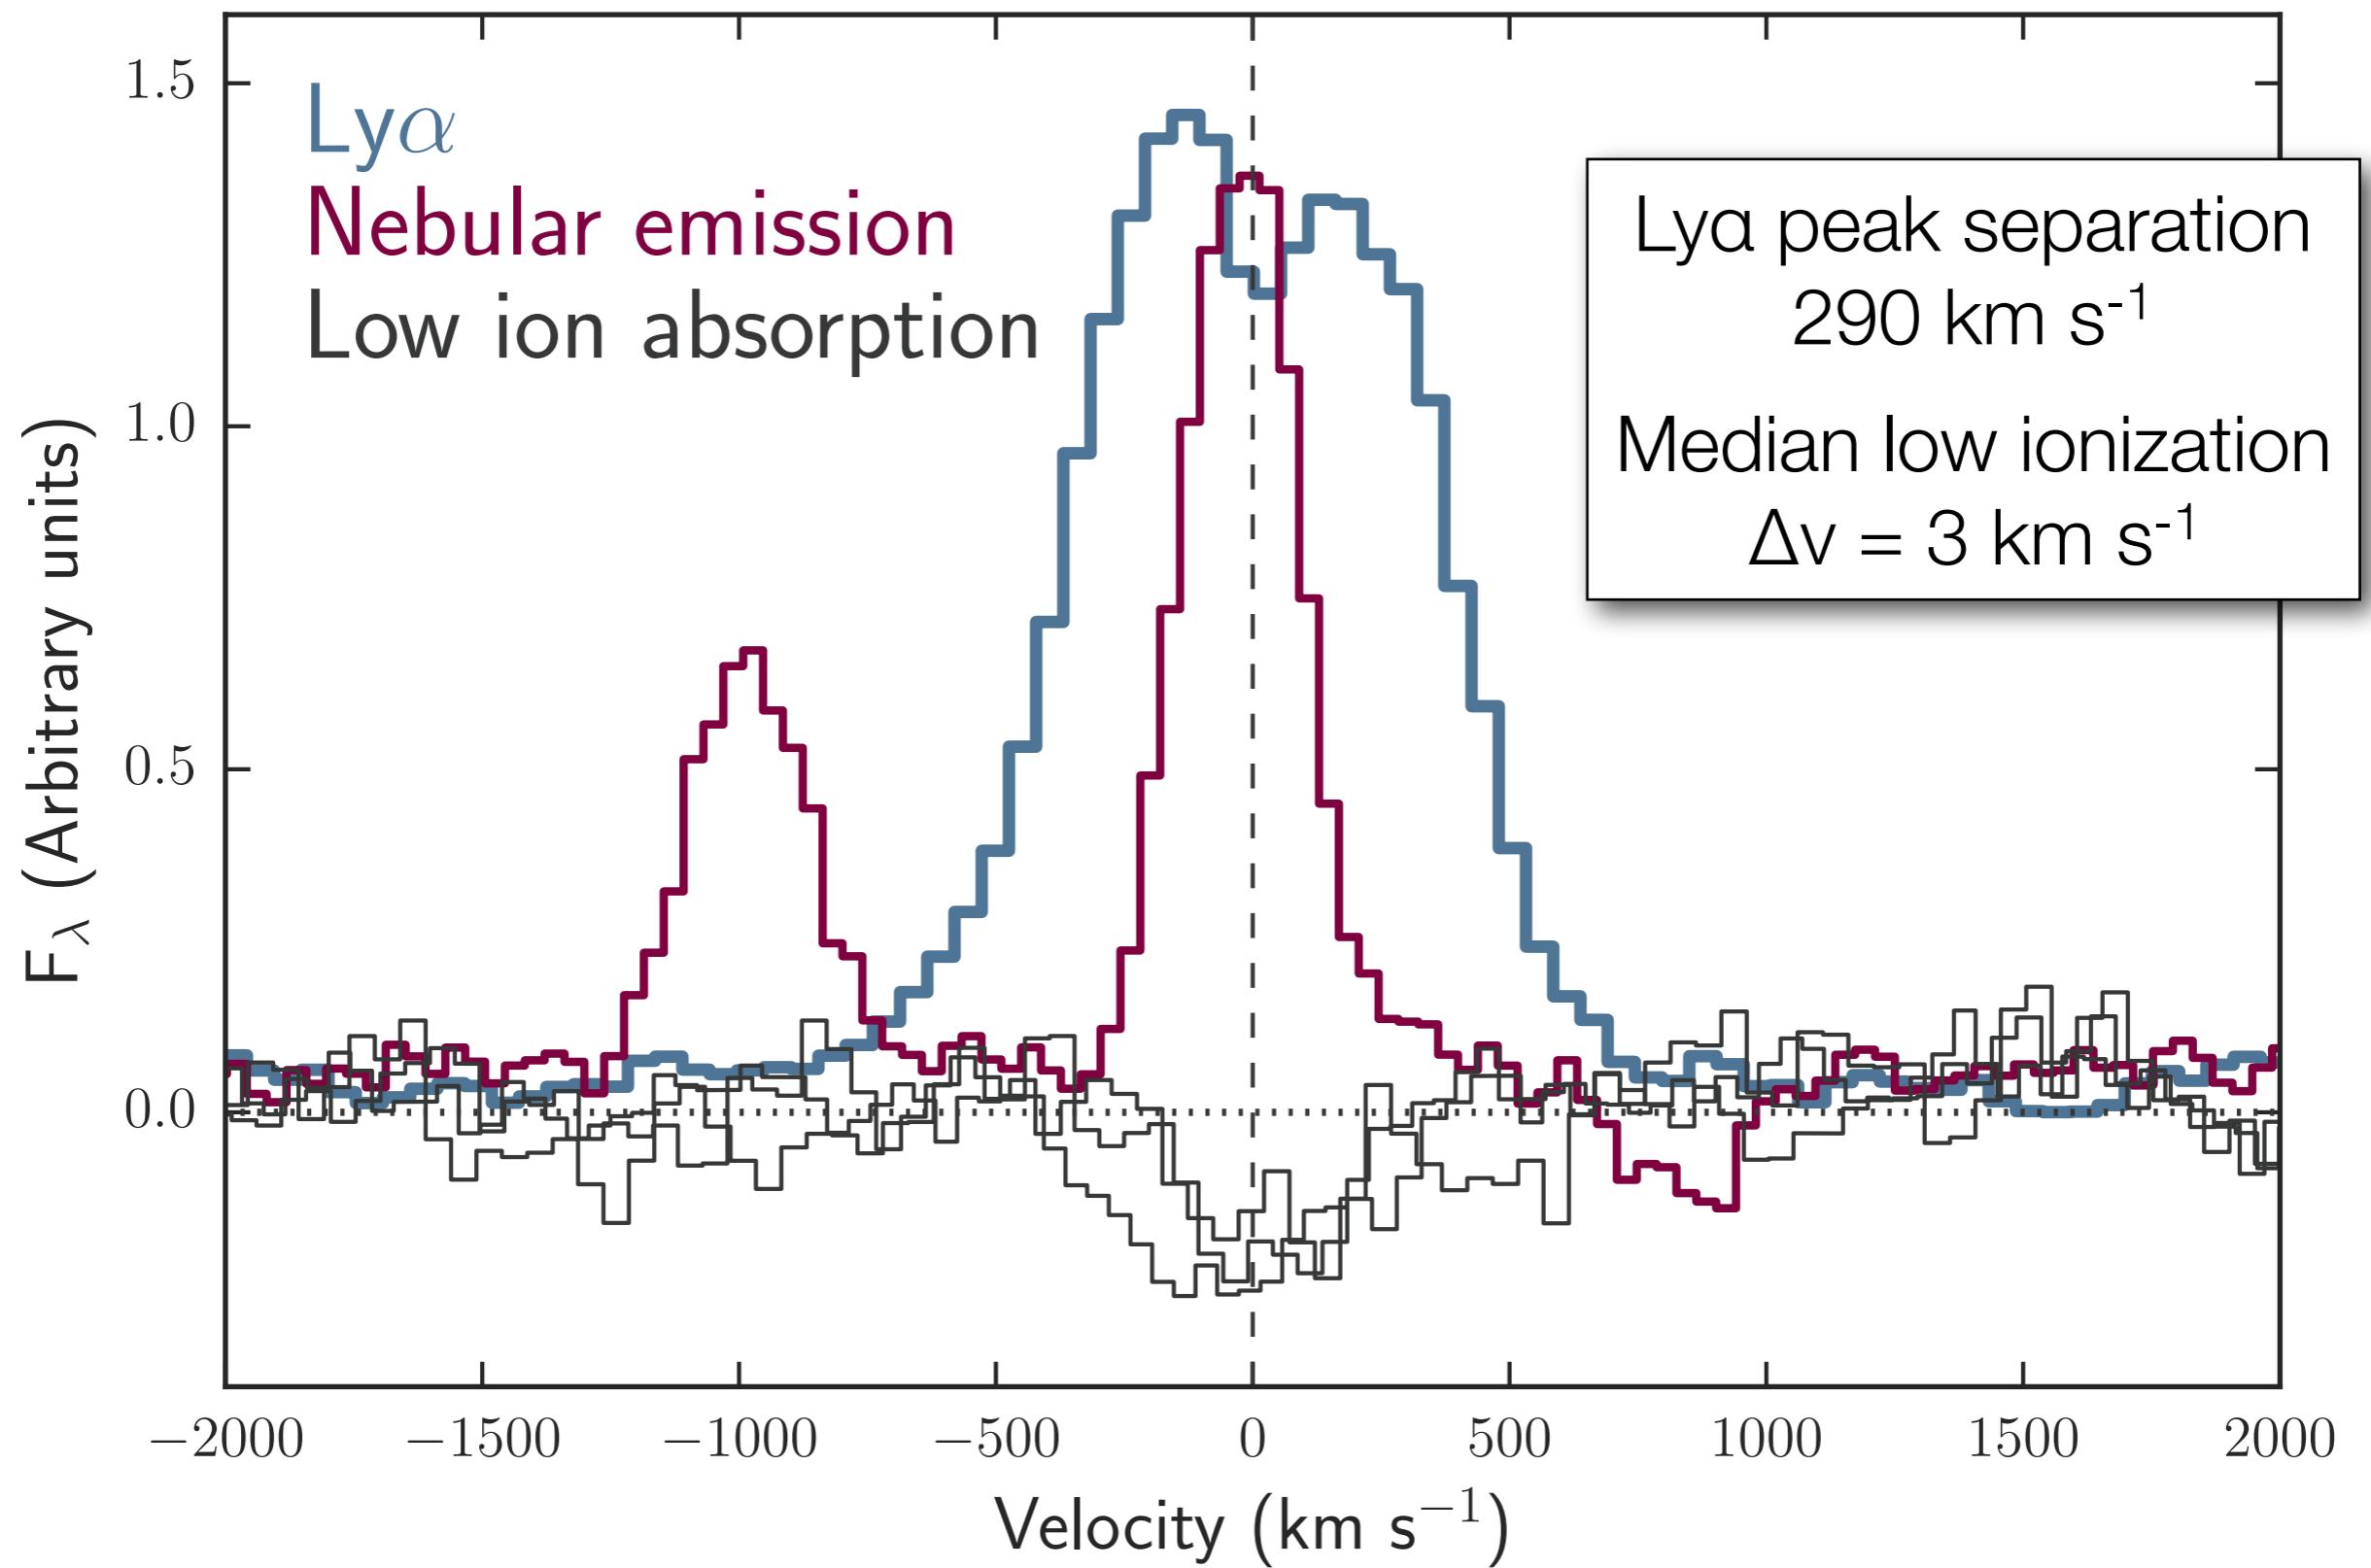

Interstellar absorption lines

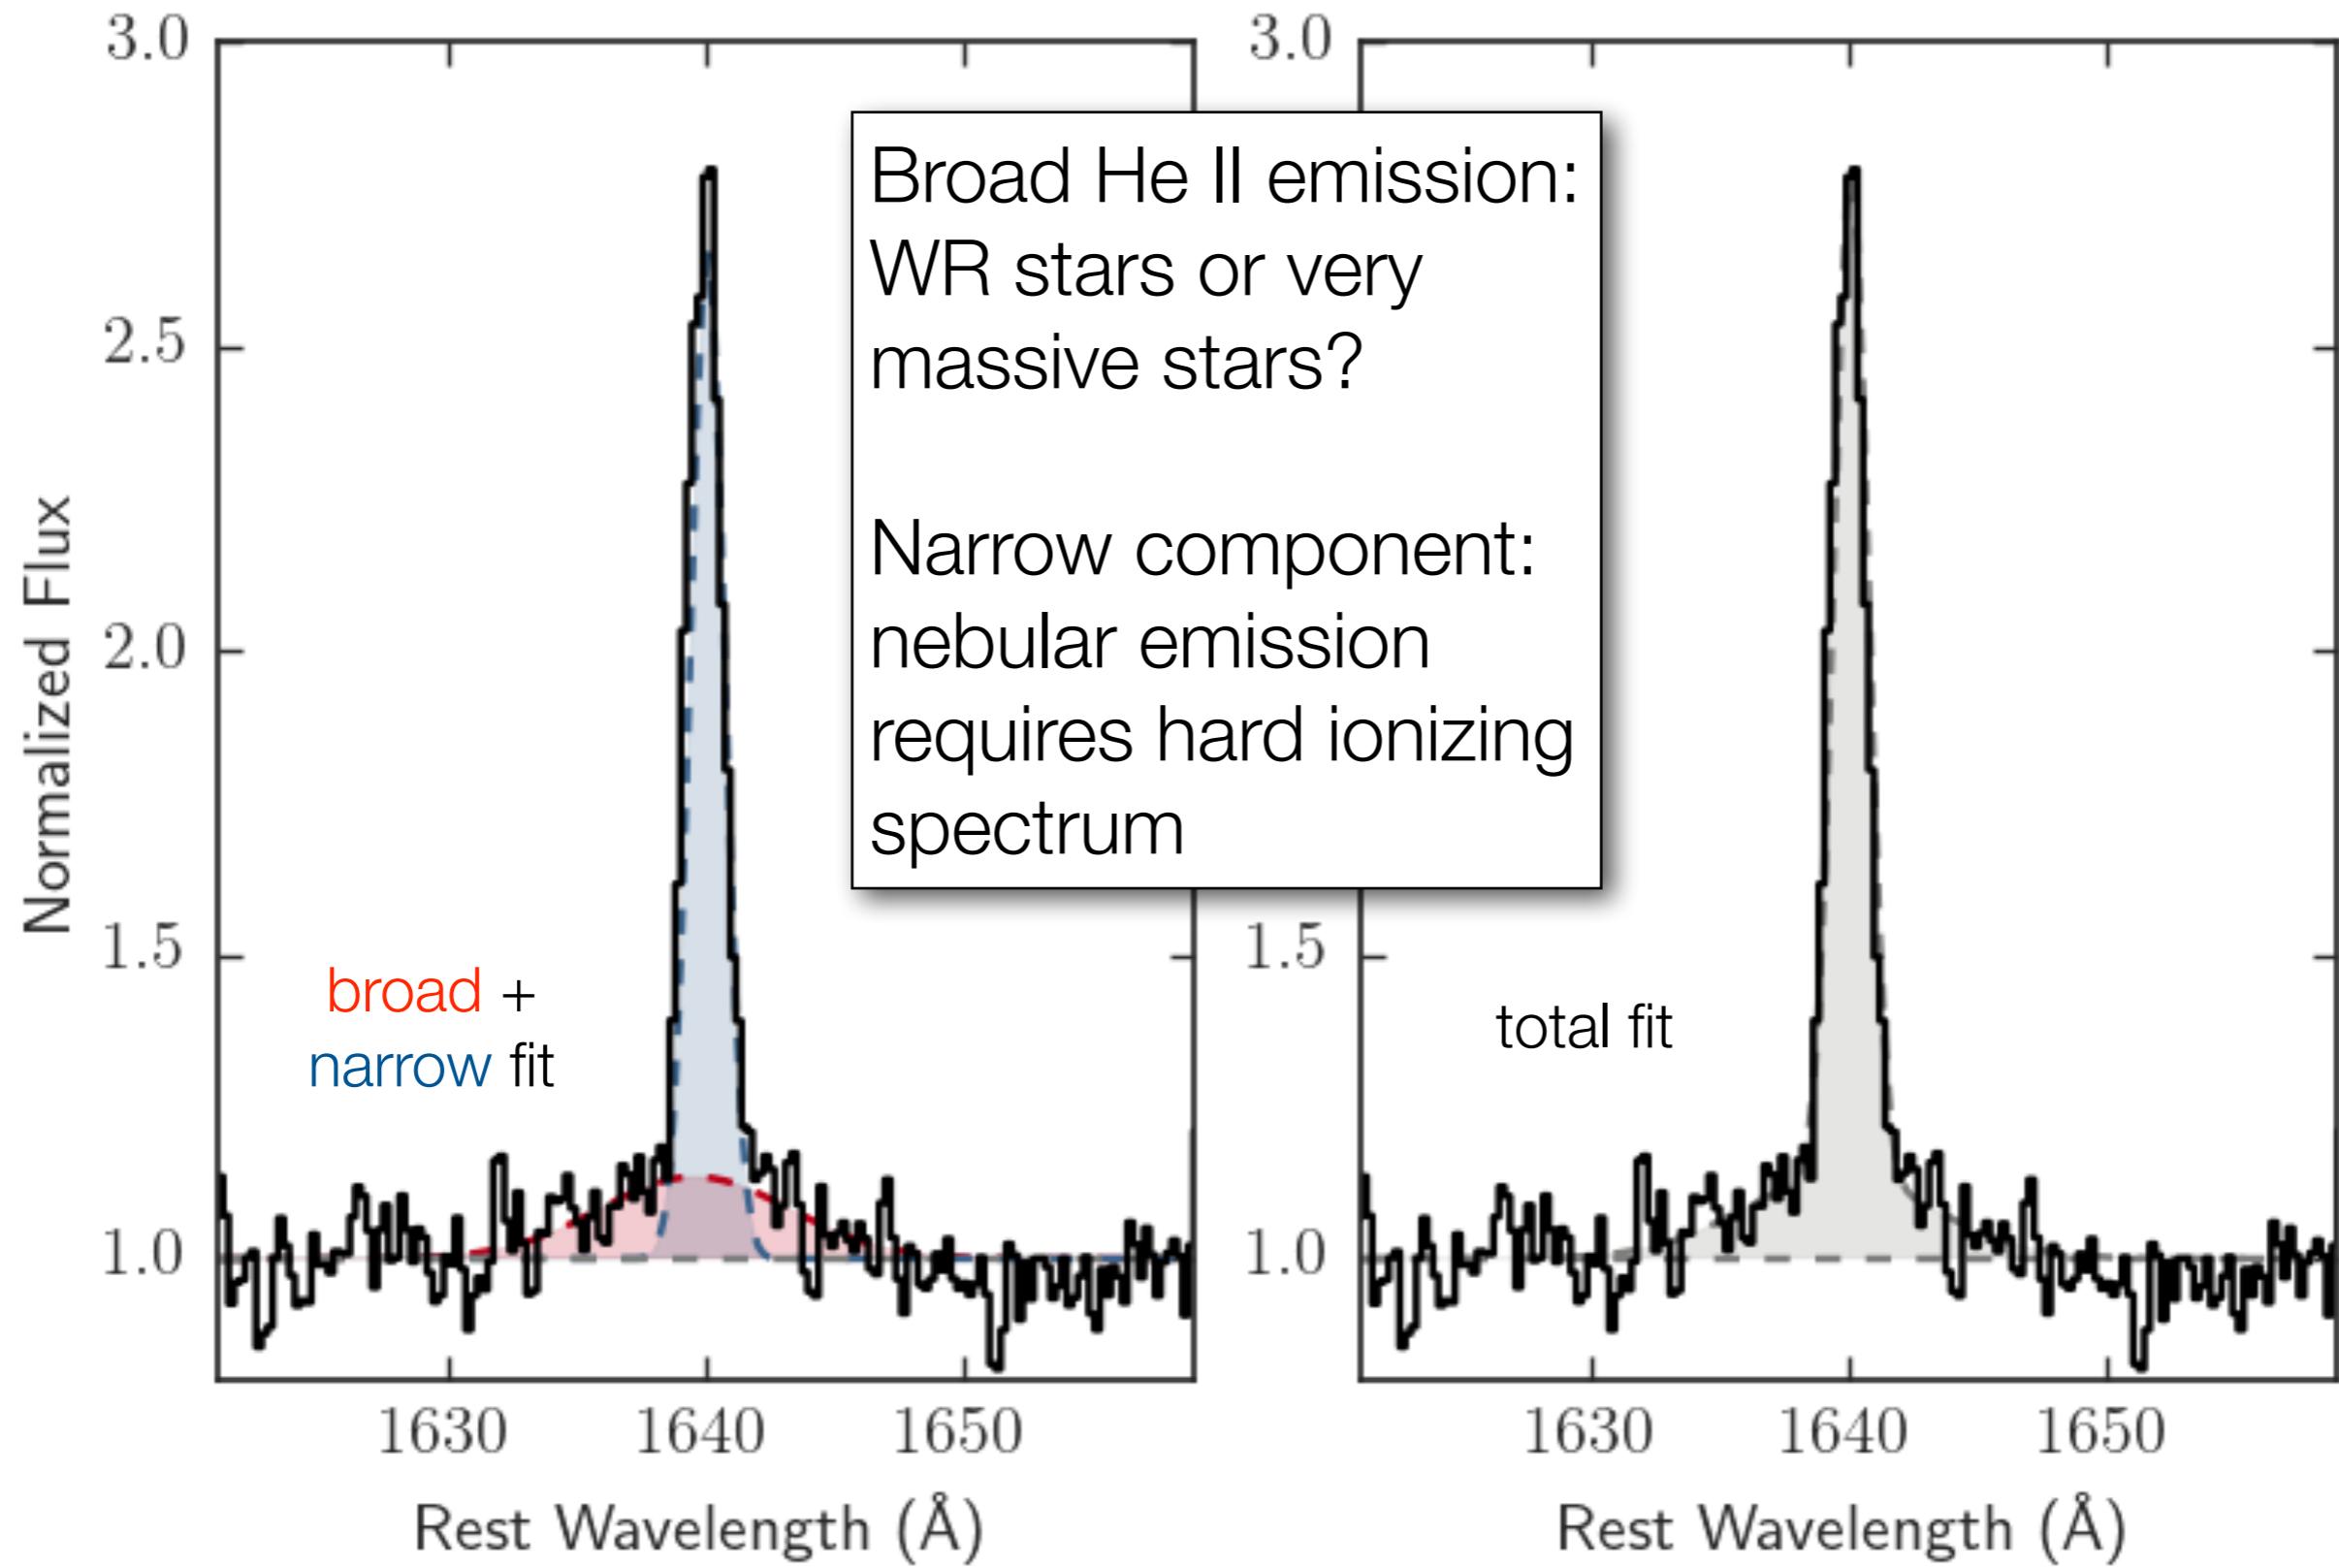

Interstellar absorption lines relatively weak ($\text{EW} \sim 0.5 - 1 \text{ \AA}$), narrow

Weak or no outflows (and $\Sigma_{\text{SFR}} = 20 \text{ M}_\odot \text{ yr}^{-1} \text{ kpc}^{-2}$)

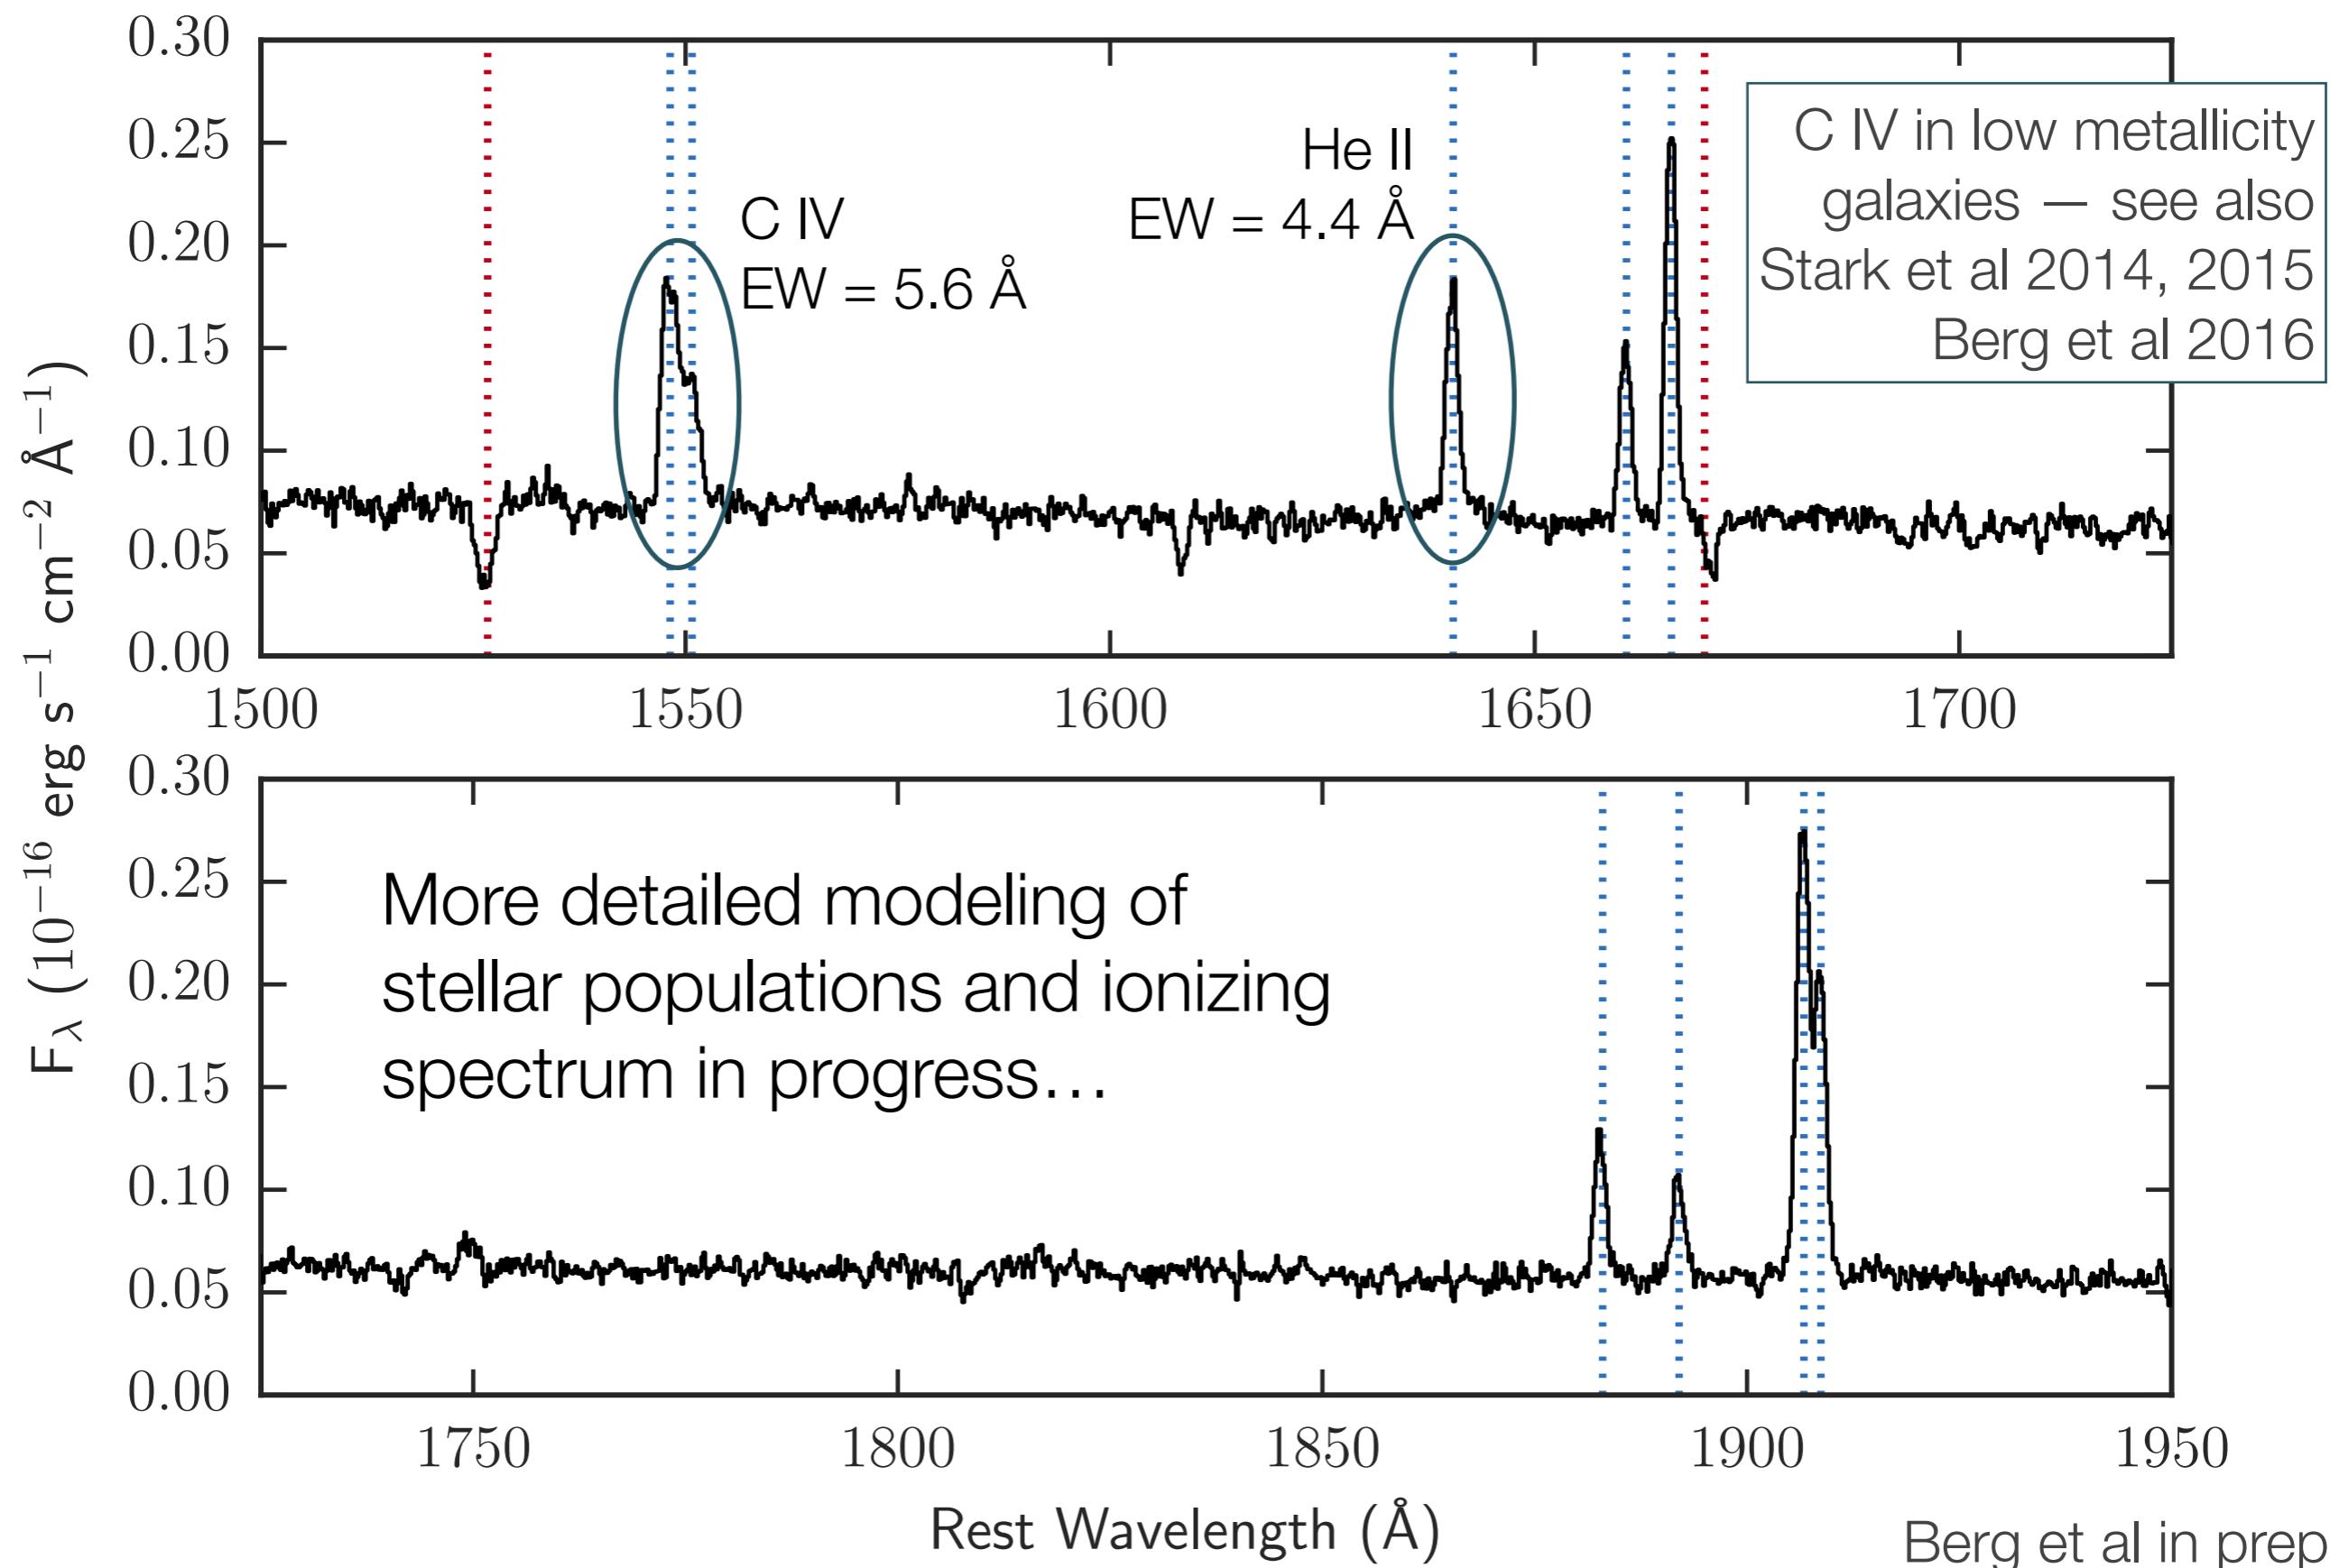

Kinematics

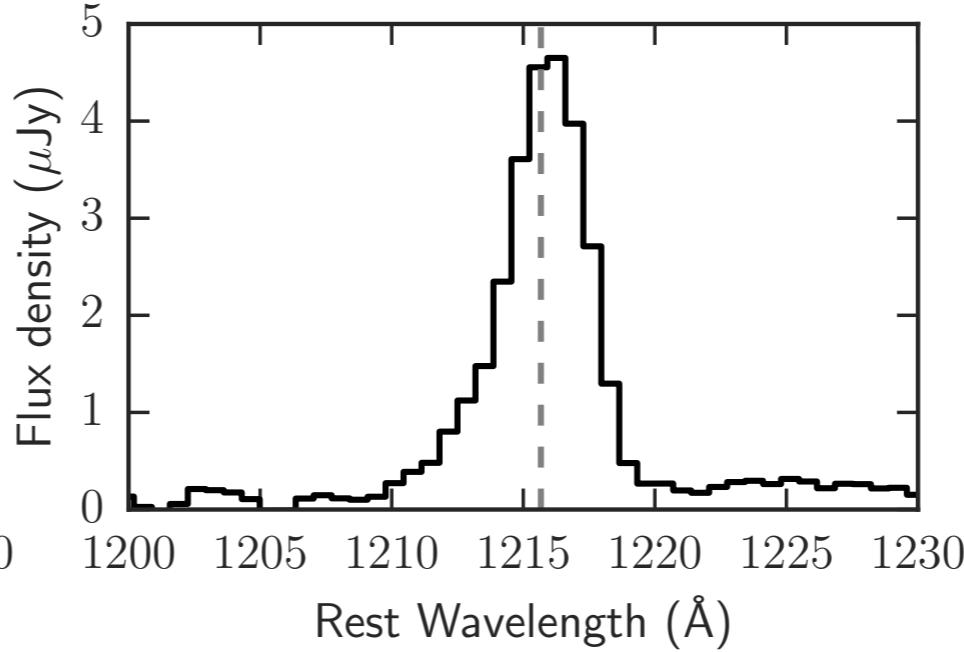

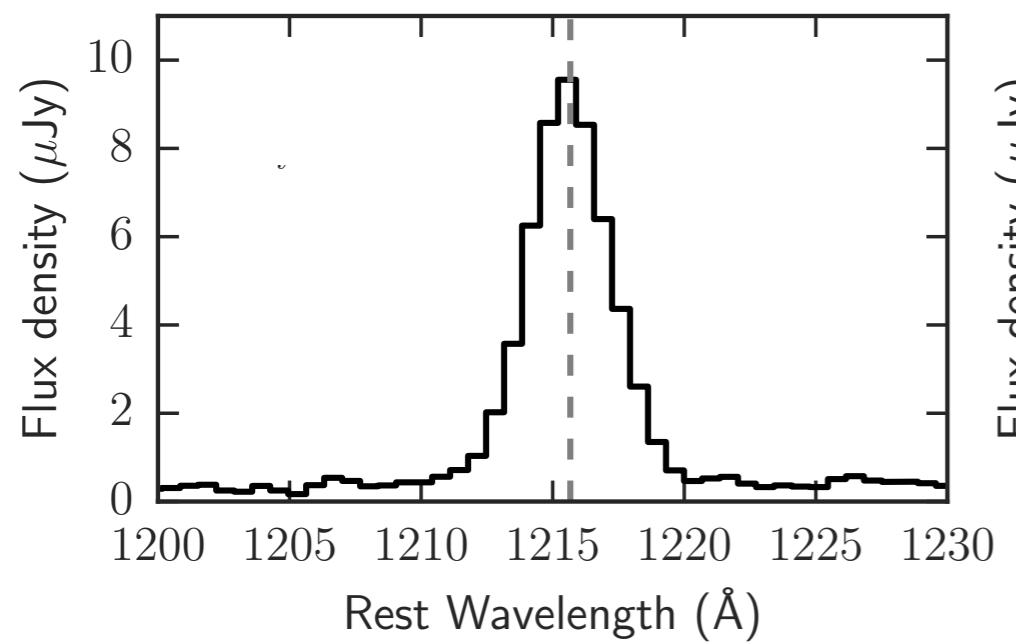

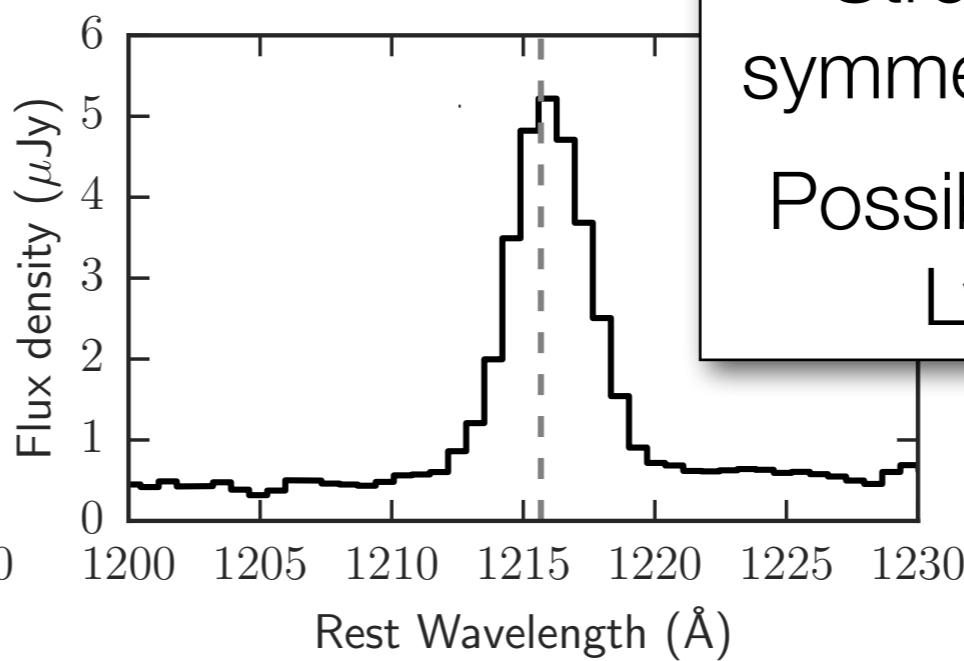

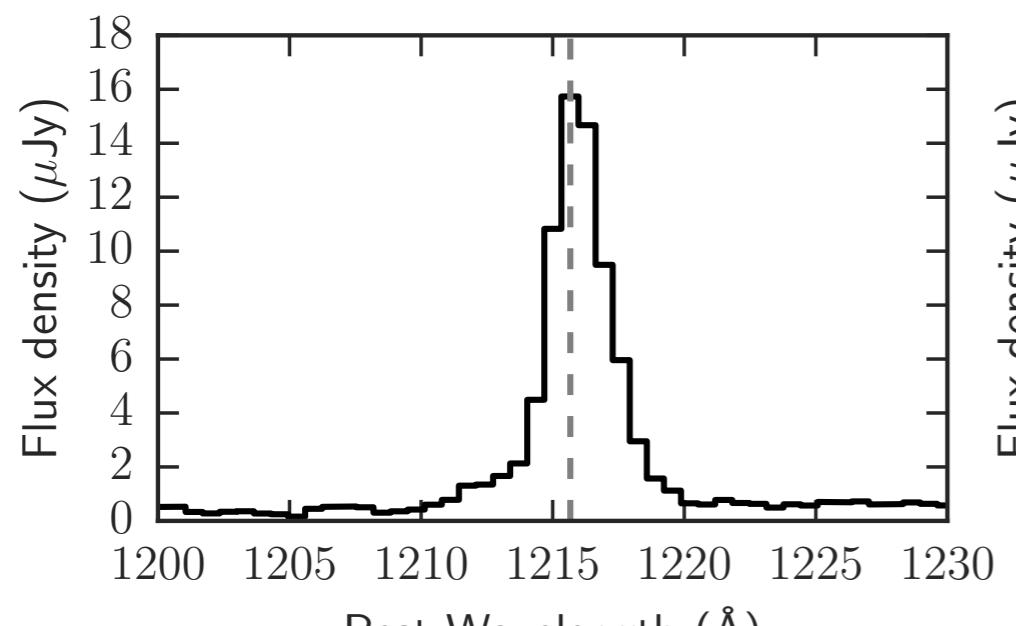

Stellar + nebular He II emission

Hard ionizing spectrum required

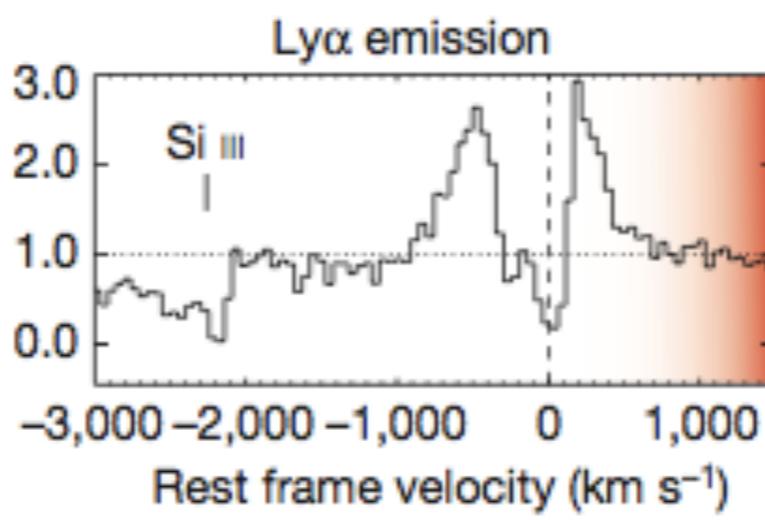

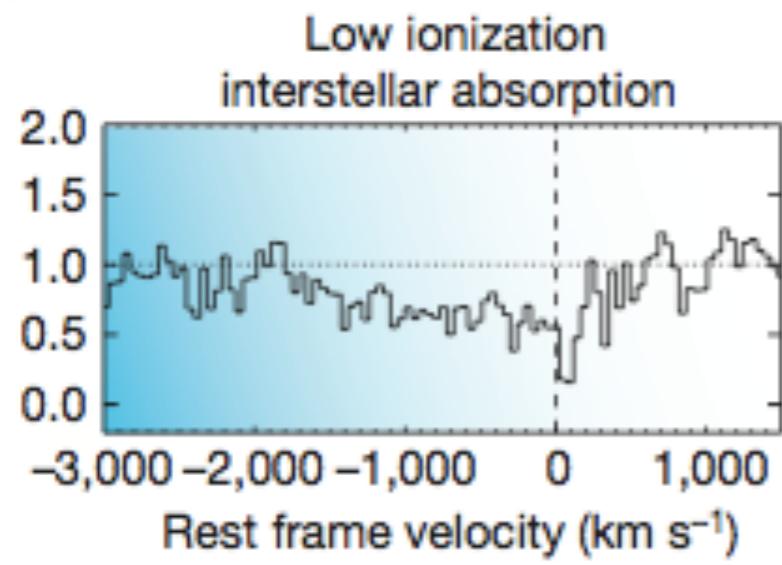

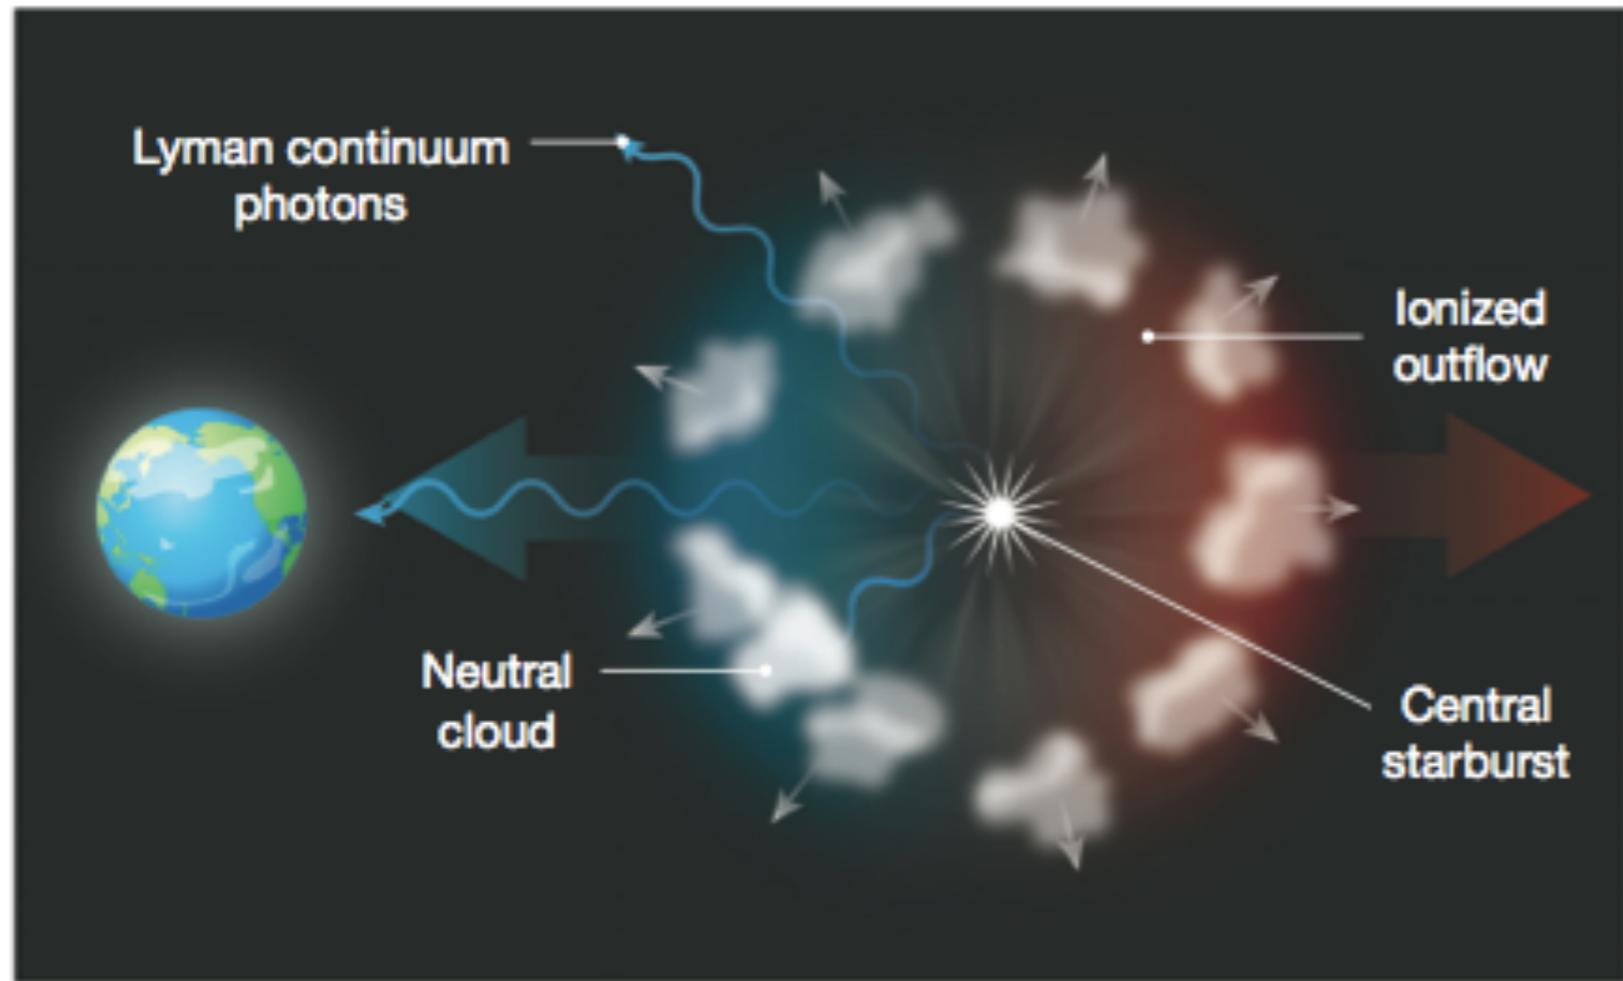

Observations of more galaxies coming soon

Strong, unusually symmetric Ly α profiles
Possible signature of LyC escape

More low mass, low metallicity z~2 galaxies:
X-shooter and deep LRIS observations scheduled

Summary: feedback in low mass galaxies at z~2

Among low mass galaxies with similar metallicities and ionization states, feedback properties inferred from interstellar absorption lines and Ly α vary widely

Timescales? Geometric effects?

Statistical sample needed
