# Cosmology using Numerical Relativity

Josu C. Aurrekoetxea 🖂, Katy Clough & Eugene A. Lim

### Abstract

This review is an up-to-date account of the use of numerical relativity to study dynamical, strong-gravity environments in a cosmological context. First, we provide a gentle introduction into the use of numerical relativity in solving cosmological spacetimes, aimed at both cosmologists and numerical relativists. Second, we survey the present body of work, focusing on general relativistic simulations, organised according to the cosmological history—from cosmogenesis, through the early hot Big Bang, to the late-time evolution of the universe. We discuss the present state-of-the-art, and suggest directions in which future work can be fruitfully pursued.

## Eugene Lim

KCL

# What is numerical relativity?

## **ADM decomposition**

Decompose the 4D spacetime metric as:

Compare to FLRW:

 $ds^{2} = -(\alpha^{2} - \beta^{i}\beta_{i}) dt^{2} + 2\beta_{i} dx^{i}dt + \gamma_{ii} dx^{i}dx^{j}$ 

 $ds^{2} = -a^{2}(\tau)d\tau^{2} + a^{2}(\tau)\delta_{ij}dx^{i}dx^{j}$ 

1 dimensional "time" is curved

 Related to the time derivative of the spatial metric

 $K_{ij} \sim -\frac{\partial_t \gamma_{ij}}{2\alpha}$ 

3 dimensional "space" is (roughly) flat

## **Constraints and evolution**

Hamiltonian constraint

$$H^2 = {8 \pi 
ho \over 3 M_{pl}^2} \qquad {\cal H} =$$

Momentum constraint

isotropy

 Evolution eqn for extrinsic curvature  $\frac{\ddot{a}}{a} = -\frac{4\pi(\rho + 3P)}{3M_{pl}^2} \qquad \partial_t K_{ij} = f(\alpha, \beta^i, \gamma_{ij}, K_{ij}, matter)$ 

## $= R + K^2 - K_{ij}K^{ij} - 16\pi\rho = 0$

## $\mathcal{M}_i = D^j(\gamma_{ij}K - K_{ij}) - 8\pi S_i = 0$

## Constraints and evolution

Constraints

### **Evolution**

Fill using Einstein equation  $\partial_{tt}g_{\mu\nu} = f(\partial_t g_{\mu\nu}, g_{\mu\nu}, T_{\mu\nu})$ 

$$\nabla_{\mu}T^{\mu\nu} = 0 \implies \partial_{t}T^{\mu\nu} = f(T_{\mu\nu}, g_{\mu\nu})$$

DYNAMICAL SPACETIME

ρ

### **NO PERTURBATIVE EXPANSION**

LARGE GRAVITATIONAL BACKREACTION (STRONG GRAVITY, RELATIVISTIC MOTION)

Challenges

# Constructing initial data

Constraints

### Goals:

### 1. Solve the constraints

2. Have the "right" physical system

## Notice the fundamental contradiction

I don't know the "correct" 4D solution (that is why I'm solving it numerically)

I want to start with a 3D slice of the "correct" solution

## The goal of constructing initial data

1. Solve the constraints

2. Have the "right" physical system

(1) is technically difficult beyond spherical symmetry (especially in periodic spacetimes), but usually doable

(2) is not a completely solved problem, due to the difficulties in separating gauge and physical degrees of freedom

# Setting boundary conditions

"space"

### Goals:

# 1. Have the "right" physical boundary

### or

2. Do something that is largely insensitive to our ignorance about the global structure of our universe

# **Boundary conditions**

Assumption of homogeneity on some scale?

How to extract GW data in non asymptotically flat spacetimes?

# Choosing gauge conditions

### Evolution

Fill using Einstein equation  $\partial_{tt}g_{\mu\nu} = f(\partial_t g_{\mu\nu}, g_{\mu\nu}, T_{\mu\nu})$ 

### Goals:

### 1. Stability

2. Sample spacetime efficiently

# Gauge conditions

### Gauge in Cosmology

### Gauge in NR

Most gauges better adapted to **BH** spacetimes

How to interpret global results?

Am I seeing gauge instabilities or physical BHs?

### Early time

X Kou., JB Mertens., C Tian, SY Zhou Gravitational waves from fully general relativistic oscillon preheating. Phys. Rev. D 105(12), 123505 (2022)

### Late time

### Easy question:

What is the average energy density of GWs on this slice of spacetime?

Better question:

What does a specific geodesic observer see as they move through the spacetime?

WE East, R Wojtak, F Pretorius Einstein-Vlasov Calculations of Structure Formation Phys. Rev. D 100(10), 103533 (2019)

### Best question:

What is the statistical distribution of measured values on the past lightcones of observers at z=0?

Said (almost) no numerical relativist ever

### Best question:

What is the statistical distribution of measured values on the past lightcones of observers at z=0?

John T. Giblin, Jr, James B. Mertens, and Glenn D. Starkman Observable Deviations from Homogeneity in an Inhomogeneous Universe The Astrophysical Journal, Volume 833, Number 2

## Summary

## NR is not always necessary but can be an important tool for non linear, strong field gravity regimes, especially in the early universe

![](_page_50_Figure_2.jpeg)

## Lots more to do!

### 7 Summary table and open questions

A summary table of the work that has been completed in the various areas covered by the review is provided in Tab. 1 for reference. We also provide here an (incomplete) list of open questions and outstanding directions that have been highlighted by the review:

### NR techniques for cosmology

- What are the optimum boundary and gauge conditions for cosmological simulations, and how do they depend on the physics being studied?
- 2. How can we access a wider range of physical scales or make approximations to allow us to study GR effects across scales, e.g. in string networks?
- 3. What are the best diagnostics for inhomogeneous spacetimes? Can spatial averages be trusted or do we always need to use geodesic observers? If so, how should they be positioned to sample the spacetime?
- 4. How can we accurately quantify GWs or other stochastic background observables in cosmological spacetimes?
- 5. How can we construct initial data that is physically "correct", as well as constraint satsfying? To what extent do arbitrary choices like conformal flatness limit the physics we can study? Can we go beyond these?
- 6. Can we develop open source tools that are general purpose for different cosmological spacetimes, e.g. a general initial condition solver for 3+1D periodic spacetimes?

### Genesis: the early universe

- 1. Does the BKL conjecture continue to hold for asymptotically flat spacetimes?
- 2. What is the role of periodic boundary conditions in findings about the robustness of inflation simulations? Do they provide a bias towards inflation?
- 3. What is the impact of considering multi-field models on the robustness of inflation?
- 4. How can the smooth contraction phase connect to the bounce in Ekpyrosis scenarios?
- 5. What are the observable consequences of either inflation or bouncing scenarios in the CMB or other observations like GW backgrounds?
- 6. Do modifications to gravity at higher energies change these behaviours? Can we connect to quantum gravity/string theory predictions?

### Exodus: the transitional universe

- How does gravity and AMR impact the evolution of a network of early universe relics? e.g. oscillons, topological defects.
- 2. Are there any (p)reheating scenarios that generate significant amounts of PBHs with small amplitude fluctuations?

Backswartion         [70, 84, 208, 285, 208, 285, 288, 288, 288, 288, 288, 288, 28	Phase transitions Primordial BH	[513, 213] [51, 52, 201- 203, 238, 258, 243- 247, 249- 258]	[214-317] [74, 205- 296]	[210-217] [74, 266, 398], [267] (collective)	[212, 213] [53, 52, 231-233, 239, 313- 247, 348- 256]	[213] [51, 52, 231- 233, 236, 269, 243- 243- 248, 243- 258, 269, 258, 269, 267]	[21:2-31:7] [74, 296]	[214-213] [12, 74, 296-268]		[213, 213] [51, 258- 238, 358, 238, 248- 247, 249- 256]
Clasevaldes [283, 313, [283, 313, [283, 313, [283, 313, ]283, 313, ]283, 313-325]	Backreastion		[79, 84, 208, 285, 286, 288, 286, 288, 800, 304, 304- 310, 312]	[70, 84, 208, 385, 288, 288, 299, 399, 300, 301, 384- 300, 342]		[50, 82, 206, 285, 286, 288, 296] (parfiet facility, [298, 900, 903] (particles), [304-310] (RH lattice), [312] (10Wo)	-	[79, 84, 208, 285, 286, 288- 284, 380, 800, 372]	[296, 296]	[280]
	Observaldes	319-325		[283, 213, 115-225]		283, 313, 313-325		[260, 313, 315-325]		

Table 1: Summary of the work in this review.

- 3. How can we best quantify the stochastic GW background produced from early universe phenomena like reheating?
- 4. What are the effects of non-spherical perturbations (i.e. going to 3+1D simulations) in the formation of PBHs?
- 5. Can we make quantitative predictions that connect observational data to parameters of the fundamental theory?

### Revelation: The late universe

- 1. What is the impact of including GR effects on systematics for next generation cosmological surveys?
- Does the assumption of periodicity that is used in most simulations impact on the (lack of) development of non-FLRW features?
- 3. Are there other GR effects that could explain cosmological tensions?
- 4. What are the signatures of modified gravity effects in the large scale structure statistics, e.g. non-linear screening?

# For discussion

- 1. What are the open questions for which NR could be useful?
- 2. What are the observables that we need to extract from the simulations, and how best to measure them?
- 3. Can we connect observables to the theory space or is there significant degeneracy?

### Late time

"What is the average energy density of GWs on this slice of spacetime?" is not the best question in NR
